TRANSCRIPT OF PROCEEDINGS
VOLUME I of III

October 15, 2013

BEFORE: The Honorable Kim Summers,
Administrative Judge, and a
Board of (7) Members

WILMA O. HUTCHISON
Licensed Court Reporter
400 Rivercrest Court
Nashville, TN 37214
(615)889-6288

1 **APPEARANCES:**

2 For the Petitioner:
3 (TN Clean Water Network)

Ms. Stephanie D. Matheny
Attorney at Law
625 Market Street
Eighth Floor
Knoxville, TN 37902

4 For the Petitioner:
5 (Southern Alliance for
6 Clean Energy)

Ms. Mary Whittle
Staff Attorney
Earthjustice
1617 John F. Kennedy Blvd.
Suite 1675
Philadelphia, PA 19103

7
8 - and -

9 Ms. Bridget M. Lee
10 Associate Attorney
11 Earthjustice
156 William Street, Ste. 800
New York, NY 10038

12 For the Respondent:

Mr. Patrick Parker
Mr. Austin Payne
Asst. General Counsels
TN Dept. of Environment &
Conservation
Wm. R. Snodgrass TN Tower
Second Floor
312 Rosa L. Parks Avenue
Nashville, TN 37243

17 For the Intervenor:

Mr. Michael K. Stagg
Mr. Ed Callaway
Attorneys at Law
Waller, Lansden, Dortch & Davis
511 Union Street, Ste. 2700
Nashville, TN 37219

20 Also Present:

Mr. Christopher W. Hayes
Ms. Lauran M. Sturm
Attorneys at Law
Waller, Lansden, Dortch & Davis

23 Ms. Kelly Love
24 Ms. Maria Gillen
Attorneys at Law
25 TVA

1 The aforementioned cause came on to be heard on
2 October 15, 2013, beginning at approximately 10:00 a.m., at
3 the Tennessee Environment & Conservation Offices, Nashville
4 Room, William R. Snodgrass Tennessee Tower, 312 Rosa L. Parks
5 Avenue, Nashville, Tennessee, before board members as follow:
6 Mr. James W. Cameron, III, Chairman, Mr. Jonathan Dales,
7 Ms. Judy Manners, Mr. John McClurkan, Mr. C. Monty Halcomb,
8 Mr. Chuck Head, and Mr. Doug Unger.

9 Also present were Dr. Sandra K. Dudley, Director
10 of the Division of Water Resources, and Mr. Mark Jordan,
11 Environmental Specialist, Division of Water Resources.

12 The proceedings were had, to wit:

PROCEEDINGS

1

2

3

THE CHAIRMAN: We are in session.

4

5

6

7

ADMINISTRATIVE JUDGE: Excellent. Good morning, everyone. My name is Kim Summers. I am the administrative judge assigned by the Tennessee Secretary of State to preside over this matter.

8

9

10

11

12

13

14

We have convened here in Nashville on October 15, 2013, for a hearing before the Board of Water Quality, Oil and Gas, Docket No. 04.30-110315A, which involves an appeal of a permit filed by Tennessee Clean Water Network and Southern Alliance for Clean Energy. The permit was granted to the Tennessee Valley Authority, which has joined the appeal as an intervenor.

15

16

17

18

19

20

As the administrative judge in this matter, I will not participate in the decision on the merits of the case. The members of the board that are present will make that decision. I will make all of the rulings on evidence, law, and procedure under the authority granted to me by the Tennessee Administrative Procedures Act.

21

22

For the record, do we have any preliminary matters to be addressed before introduction of the Board?

23

24

25

MS. MATHENY: Yes, Your Honor.

MR. PARKER: Your Honor, as we have

previously talked to you about, we're going to be dealing with

1 many jurisdictional permit issues.

2 ADMINISTRATIVE JUDGE: Yes.

3 MR. PARKER: The parties have a
4 stipulation they'd like to give you, and then you can make
5 whatever findings you think --

6 ADMINISTRATIVE JUDGE: Okay. Pursuant to
7 the joint stipulations to get on the record, the parties
8 jointly agree that the petitioners have met the requirements
9 of 69-3-105 in order to have standing to file this appeal.

10 If I could just -- I mean, that's my read.
11 Based upon your joint stipulations and the law, I find that
12 the parties or that the petitioners do have standing. And I
13 just want to understand from the parties that you have agreed
14 that that is also your understanding.

15 MS. WHITTLE: Yes, Your Honor.

16 MR. PARKER: Yes, Your Honor.

17 ADMINISTRATIVE JUDGE: Okay, very good.
18 If I could get the board members to identify themselves for
19 the record, please.

20 MR. DALES: Jonathan Dales.

21 MS. MANNERS: Judy Manners, Tennessee
22 Department of Health representative.

23 THE CHAIRMAN: Jim Cameron.

24 MR. McCLURKAN: John McClurkan.

25 MR. HALCOMB: Monty Halcomb.

1 MR. HEAD: Chuck Head with the Department
2 of Environment and Conservation.

3 MR. UNGER: And Doug Unger.

4 ADMINISTRATIVE JUDGE: And just for the
5 record, Mr. Chairman, we do have a quorum?

6 THE CHAIRMAN: Yes, ma'am.

7 ADMINISTRATIVE JUDGE: Very good. This
8 may be a lengthy process. But for the benefit of our court
9 reporter, if the attorneys who will be participating in the
10 hearing would identify themselves and their client for the
11 record, please, starting with the petitioners.

12 MS. MATHENY: Your Honor, I'm Stephanie --

13 ADMINISTRATIVE JUDGE: I think we're going
14 to need to make sure we're --

15 MS. MATHENY: I'm Stephanie Matheny. I'm
16 one of the attorneys for the petitioners in this case for the
17 Tennessee Clean Water Network and the Southern Alliance for
18 Clean Energy.

19 ADMINISTRATIVE JUDGE: And if you want to
20 identify your co-counsel, that might be easier, rather than --

21 MS. MATHENY: And with me here today are
22 Bridget Lee and Mary Whittle with Earthjustice.

23 ADMINISTRATIVE JUDGE: Thank you.

24 MR. PARKER: Your Honor, my name is
25 Patrick Parker. I represent the Department of Environment and

1 Conservation, and co-counsel's name is Austin Payne.

2 MR. STAGG: Your Honor and Board, my name
3 is Michael Stagg. I'm here today on behalf of the Tennessee
4 Valley Authority. With me are my co-counsel, Ed Callaway,
5 Lauran Sturm, Chris Hayes, and also two attorneys from TVA,
6 Kelly Love and Maria Gillen.

7 ADMINISTRATIVE JUDGE: Thank you all very
8 much. Unless there is an objection from the parties or the
9 Board, I will dispense with a recitation of the technical
10 record in this matter, which includes 97 documents primarily
11 involving preliminary procedural matters.

12 Any documentary evidence that is included
13 in the technical record that should be considered by the Board
14 in making its decision will be made by the parties during the
15 course of this hearing. The pleadings report will be
16 available for review by the parties and board members upon
17 request. Any objection?

18 Board members are reminded that the law
19 requires you to disclose on the record any outside knowledge
20 of this case or any communications, whether written, verbal,
21 or otherwise, from any parties concerning this case. Assuming
22 that you already had one board member recuse himself, any
23 other board members with any personal knowledge that needs to
24 be disclosed? Very good.

25 Members of the board are also reminded

1 that during the time this hearing is being conducted, no
2 discussion concerning this case should take place between
3 board members or with witnesses, attorneys, or other persons
4 unless all parties are present.

5 During the hearing this Board sits as a
6 jury and must only consider evidence introduced at the hearing
7 in reaching its decision. The Sunshine Law requires all board
8 discussions and deliberations to be in public before all
9 parties. Failure to observe the Sunshine Law may result in
10 the Board's action being reversed or remanded if appealed to
11 Chancery Court.

12 Do the parties have stipulations of facts
13 to present to the Board?

14 MR. PARKER: We do, Your Honor, and we
15 have some materials to pass out to the Board. So this might
16 be a good time to do that, and that way we don't -- the
17 stipulations are in the binders, if we could just have a few
18 minutes to get that done.

19 ADMINISTRATIVE JUDGE: Okay. Let's do
20 that.

21 (Pause in proceedings.)

22 (BY THE ADMINISTRATIVE JUDGE) The
23 stipulations, which appear to be under the first tab, are
24 facts that have been agreed to by the parties, and we'll
25 consider them as if they had been proven to be true during the

1 hearing.

2 Are all of the witnesses that will be
3 testifying today in the room?

4 MR. PARKER: I believe so, Your Honor.

5 ADMINISTRATIVE JUDGE: Okay. Are we
6 invoking the rule?

7 MR. PARKER: No. Parties waive.

8 ADMINISTRATIVE JUDGE: Okay. We will
9 swear the witnesses as they testify. Just some procedural
10 matters to take up before we start, if the board members will
11 just let us know whenever they need a break. I understand
12 that our opening statements today may run close to two hours.
13 That may be a good time, after opening statements, to take a
14 lunch break. Is there a preference on how long the lunch
15 break would last?

16 THE CHAIRMAN: We usually take about an
17 hour.

18 ADMINISTRATIVE JUDGE: Okay. And a
19 preference on how long we go today?

20 THE CHAIRMAN: Why don't we talk about it
21 at lunch and see --

22 ADMINISTRATIVE JUDGE: Okay. And then
23 we'll just kind of --

24 THE CHAIRMAN: We generally go until about
25 5:00. We try to accommodate people who have to catch buses or

1 rides or whatever.

2 ADMINISTRATIVE JUDGE: Okay, very good.
3 Anything else that we need to take up before we commence with
4 opening statements? No? All right. Ms. Matheny? And I just
5 want to remind counsel to speak into that microphone. And I
6 think if you don't see that red light on, it's not picking up,
7 and then the court reporter might have a difficult time
8 hearing.

9 MS. MATHENY: Your Honor, we also have
10 exhibit lists to share with the parties.

11 ADMINISTRATIVE JUDGE: Okay.

12 MS. MATHENY: Members of the Board, Judge
13 Summers, thank you for joining us here today and for the next
14 several days to hear this appeal. I've already introduced
15 myself and my co-counsel. I'd also like to introduce Dr. John
16 Koon, who'll be testifying for petitioners later. We expect
17 Angela Garrone of the Southern Alliance for Clean Energy to
18 join us at later stages of the hearing.

19 This hearing concerns the national
20 pollutant discharge elimination system, or NPDES, permit for
21 the TVA's Bull Run Fossil Plant in Clinton, Tennessee, which
22 was issued by TDEC in September of 2012.

23 Bull Run is a 950-megawatt power plant
24 that burns coal to create electricity. In the process, this
25 plant produces vast quantities of coal ash, much of which is

1 sluiced to its unlined settling ponds. The plant also has an
2 air scrubber, which discharges high test wastewater to the
3 ponds. These ponds, which are shown here in an aerial view on
4 the left, discharge to the Melton Hill Reservoir of the Clinch
5 River through Outfall 001.

6 The Melton Hill Reservoir is a beautiful
7 recreational destination frequented by people who boat, fish,
8 and otherwise enjoy our state waters, as you can see in this
9 picture taken over the weekend at Melton Hill Park, which is
10 just a few miles downstream from the plant.

11 The Melton Hill Reservoir is also a source
12 of drinking water for people served by the West Knox Utility
13 District, which, as you can see in this picture, has its
14 intake immediately downstream from Outfall 001.

15 Petitioners have asked TDEC to impose
16 numeric technology-based effluent limits on toxic pollutants
17 such as mercury, selenium, and arsenic in Bull Run's coal ash
18 discharges. But, instead, TDEC is waiting on guidance from
19 the federal government, guidance which has not been
20 forthcoming for 30 years and which may, in fact, never come.

21 In the meantime, TVA, the agency
22 responsible for the release of 5.4 million cubic yards of coal
23 ash from Kingston's settling ponds to the Clinch River release
24 is left to police itself and to discharge toxics without
25 limits from Bull Run's settling ponds to the Clinch River.

1 EPA has made it abundantly clear that it
2 expects delegated state water agencies to set limits on coal
3 ash that reflect the best available technology economically
4 achievable, or BAT, and this is an acronym you're going to
5 hear a lot in the next few days, best available technology
6 economically achievable, BAT, in the absence of applicable
7 federal guidance.

8 The Franklin Circuit Court of our neighbor
9 to the north, Kentucky, ruled just last month in a case nearly
10 identical to this one that its state water agency cannot just
11 sit and wait for EPA to act and, instead, must comply with the
12 obligations to fully protect its waters without further delay.

13 Instead of following the requirements of
14 the Tennessee Water Quality Control Act and unambiguous EPA
15 guidance, TDEC issued the permit for Bull Run without any
16 BAT-based effluent limits on toxic pollutants at Outfall 001.

17 Instead, the permit sets limits only on
18 conventional pollutants, including total suspended solids, oil
19 and grease, and pH. TDEC derived these limits from EPA's 1982
20 effluent limitation guidelines.

21 These guidelines set limits based on the
22 performance of settling ponds, the same rudimentary technology
23 used to remove dirt from construction runoff, technology that,
24 as EPA, TDEC, and petitioners agree, is not effective at
25 removing dissolved metals in coal ash discharges.

1 As the evidence will show, a great deal
2 has changed in the 31 years since EPA issued these rules,
3 including the wide-scale installation of air scrubbers, like
4 the one at Bull Run, that remove pollutants from air
5 emissions, but move them to wastewater discharges, and the
6 development of new, more sophisticated wastewater treatment
7 technologies that are far more effective than settling ponds
8 at removing toxics, particularly dissolved metals.

9 In the next few minutes I will address the
10 background of this permit, including Bull Run's coal
11 combustion discharges, EPA's 1982 guidelines, EPA's recent
12 rulemaking, and of course I'll address this permit. And then
13 I will turn to the key issues this Board will be asked to
14 decide at the end of the hearing.

15 First, TDEC has a legal duty to set
16 case-by-case best professional judgment limits in this permit
17 pursuant to the Tennessee Water Quality Control Act.

18 Next, I'll turn to TDEC's failure to
19 conduct a BPJ analysis or set BAT limits.

20 Then I'll move to feasibility of setting
21 numeric BAT limits based on more advanced technologies than
22 settling ponds. I'll address the permit's flawed best
23 management practices provision. And, finally, I will briefly
24 discuss the petitioners and their affected members.

25 Petitioners expect that you will hear

1 testimony describing the operation of TVA's Bull Run Fossil
2 Plant and the various wastewater streams that are discharged
3 from Outfall 001. While these are complicated processes, and
4 there are many wastewater streams, there are really just a few
5 key points that are essential to understanding this case.

6 First of all, TVA began operating its flue
7 gas desulfurization, or FGD, scrubber in December of 2008,
8 which is photographed here. The scrubber is very effective at
9 removing pollutants from the air, and all of us who live
10 downwind from Bull Run are very grateful to TVA for that. But
11 now these pollutants are discharged in wastewater instead.

12 As you can see in these slides, the
13 scrubber wastewater is, far and away, the most toxic
14 wastewater stream remaining at Bull Run today. This slide
15 depicts the results of TVA's 2010 internal sampling of
16 wastewater streams, and specifically this slide addresses
17 arsenic. The tall blue line in the middle is the arsenic
18 found in the scrubber wastewater. And as you can see, it's a
19 much higher concentration than in the other wastewater
20 streams.

21 Similarly, for mercury the tall line is
22 for the scrubber wastewater. And, in fact, all of the other
23 wastewater streams were non-detect for mercury. And similarly
24 for selenium, the tall line there is scrubber wastewater.

25 Now, this is just a sampling of the metals

1 found in Bull Run's scrubber wastewater, but they are the key
2 pollutants the petitioners are most concerned about.

3 In addition to scrubber wastewater, TVA
4 still discharges bottom ash wastewater through Outfall 001.
5 This is a relatively high volume wastewater stream but has
6 much lower concentrations of pollutants than the scrubber
7 wastewater. Other wastewater streams at issue here include
8 coal pile runoff, metal cleaning wastes, and a variety of
9 minor wastewater streams.

10 These wastewater streams mix together in
11 Bull Run's settling ponds, which are photographed here.
12 Together with the rain and snow that fall in these vast ponds,
13 these miscellaneous wastewater streams serve to substantially
14 dilute the scrubber wastewater as measured in Outfall 001,
15 which is, in fact, the only location where TDEC has ever
16 required TVA to sample its coal ash discharges.

17 EPA's 1982 guidelines set limits on total
18 suspended solids, oil and grease, and pH, but did not set BAT
19 limits for low volume wastes, scrubber wastewaters, bottom
20 ash, or coal pile runoff, except to retain a preexisting
21 prohibition on a discharge of PCBs.

22 When it issued these ELGs, EPA explained
23 regarding low volume wastewaters that "toxic pollutants are
24 excluded from national regulation, because they are present in
25 amounts too small to be effectively reduced by technologies

1 known to the administrator."

2 This language was recently construed in
3 the Kentucky decision I mentioned earlier. In that case,
4 which addressed the same ELG at issue here, Judge Phillip
5 concluded that "the dissolved metals at issue here are plainly
6 not subject to the 1982 ELG. Instead, they were excluded from
7 the ELG."

8 EPA has finally begun the process of
9 establishing the limits failed to set more than 30 years ago.
10 Ironically, these renewed efforts were sparked by concerns
11 thrown into the national spotlight by TVA's Kingston spill and
12 also its smaller Widows Creek spill. These spills coincided
13 with a new focus on regulating toxic air emissions, which led
14 to installation of air scrubbers at many coal plants,
15 including Bull Run.

16 Out of concern that an already toxic stew
17 of coal ash wastewater was largely managed through unlined,
18 hazardous coal ash ponds, like the very same ponds that are at
19 issue here, and were receiving evermore toxic wastewater
20 discharger from these air scrubbers, EPA undertook a study of
21 more advanced treatment options which were published in 2009.

22 While it did not select a technology as
23 BAT at that time, EPA clearly indicated that settling ponds
24 were not going to be considered BAT and that more advanced
25 treatment like chemical precipitation, biological treatment,

1 or zero liquid discharge would be required.

2 Pursuant to a consent decree, EPA then
3 undertook to develop new effluent limitation guidelines to set
4 BAT on a national level.

5 You will be shown the June 2010 memorandum
6 from James Hanlon of EPA, which provides interim guidance for
7 issuing NPDES permits for scrubber discharges and coal ash
8 impoundments until the new regulations are finalized.

9 This memorandum, which was before TDEC
10 when it issued this permit, made it abundantly clear that
11 EPA's 1982 guidelines did not cover toxics in these
12 wastewaters and that delegated states must apply longstanding
13 rules to develop their own case-by-case BAT limits. And that
14 is precisely what petitioners have asked TDEC to do here.

15 States like New York, Pennsylvania, and
16 Indiana are doing this now, and it's time for Tennessee to get
17 on board.

18 After several extensions, EPA finally
19 published draft guidelines in the Federal Register this June.
20 Right before the federal shutdown, EPA received a slew of
21 comments from industry and environmentalists but obviously has
22 not been working on these guidelines lately.

23 Under the terms of the consent decree, EPA
24 is supposed to issue final guidelines next May. While
25 obviously none of us can predict the future, given past

1 delays, the controversy surrounding this rulemaking, and the
2 government shutdown, it is quite foreseeable that this
3 deadline will come and go without a final rule.

4 Moreover, even once EPA issues new
5 guidelines, there's a very high likelihood that they will be
6 appealed and quite possibly stayed while that litigation plays
7 out.

8 In the meantime, plants like Bull Run will
9 continue to operate and discharge toxic coal ash wastewaters.
10 In this situation it is up to TDEC to fulfill its
11 responsibilities as the primary regulator of surface water in
12 Tennessee to set BAT limits on toxics in the permit now.

13 As I stated earlier, TVA began operation
14 of its new scrubber in December 2008. At the time TDEC
15 allowed TVA to add this highly toxic wastewater stream simply
16 by writing a letter, without modifying the permit.

17 In January 2010 TDEC issued a draft permit
18 that included the scrubber wastewater. In April 2010
19 petitioner Tennessee Clean Water Network submitted detailed
20 comments regarding the draft permit. These comments asked
21 TDEC to develop numeric BAT limits on a BPJ basis at Outfall
22 001.

23 TDEC issued the final permit on September
24 30, 2010. In this permit TDEC provided a response to comments
25 that included a section titled *Best Professional Analysis*,

1 which I'll address in a moment. The final permit added a best
2 management practices provision and increased metals monitoring
3 requirements. But, critically, the final permit did not
4 impose BAT limits on the discharge of metals in coal
5 combustion wastewaters.

6 This permit is set to expire next month on
7 November 1st. However, because TVA timely applied to renew
8 its permit, TDEC can administratively extend the permit for
9 pretty much as long as it chooses.

10 Without direction from this Board for TDEC
11 to reopen the permit and impose appropriate BAT limits,
12 TDEC's actions, to date, leave every reason to believe it will
13 continue to wait for EPA, a federal agency that is not even
14 working at the moment, to come up with an answer for how to
15 regulate the Tennessee Valley Authority's discharges to
16 Tennessee waters.

17 Now I'm turning to the key legal question
18 at issue in this case, the question you will have to answer at
19 the conclusion of this hearing. Does the Tennessee Water
20 Quality Control Act require TDEC to conduct a BPJ analysis and
21 impose BAT limits on toxics in Bull Run's coal ash discharges,
22 and the answer is quite clear. TDEC must do this, because
23 EPA's 1982 guidelines do not cover these pollutants or
24 wastewater streams.

25 The Tennessee Water Quality Control Act

1 requires TDEC to impose effluent limits to accomplish the
2 purposes of the Act and to implement this Board's regulations.

3 In addition -- and this is the part that's
4 highlighted on your slide -- TDEC must set the most stringent
5 effluent limitations necessary to comply with other state or
6 federal laws or regulations. This means that TDEC must comply
7 with the Clean Water Act, applicable EPA regulations, and this
8 Board's rules when it issues permits.

9 But let's start with Tennessee's
10 regulations. And I'm not going to go through all of them, but
11 you do have the smaller binder in front of you that has full
12 copies of everything that's going to be cited over the next
13 few days.

14 Rule 1200-04-05-.08 requires TDEC to set
15 BAT limits as required by the Clean Water Act. So that's a
16 requirement Tennessee has incorporated into its rule directly.

17 Rule 1200-04-05-.09 directs TDEC to use
18 best professional judgment to develop effluent limitations in
19 the absence of applicable federal guidelines.

20 And, Members of the Board, there is no
21 dispute on this next point. The Tennessee Water Quality
22 Control Act, the Clean Water Act, and both the state and
23 federal regulations clearly and unambiguously require TDEC to
24 impose technology-based effluent limits in every NPDES permit
25 as the minimum level of control, unless more restrictive water

1 quality based limits are required.

2 As shown in this slide, EPA regulations
3 establish the only three ways to set these technology-based
4 effluent limits.

5 TDEC knows that when there is a federal
6 effluent guideline, it must apply that to set technology-based
7 limits. That's the first option.

8 TDEC also knows that when there is no
9 federal effluent guideline, it must use BPJ to develop
10 case-by-case technology-based effluent limits. That's the
11 second prompt up there.

12 But in this case, federal guidelines apply
13 to some pollutants and some waste streams but not to others.
14 In this situation, EPA makes it clear that permit writers must
15 use best professional judgment to set technology-based limits
16 on the pollutants and waste streams that are not covered, and
17 that's in 40 CFR 125.3(c)(3), and I've highlighted the
18 important language.

19 EPA establishes that where promulgated
20 effluent limitation guidelines only apply to certain aspects
21 of the discharger's operations or to certain pollutants, other
22 aspects or activities are subject to regulation on a
23 case-by-case basis in order to carry out the provisions of the
24 Act.

25 And a central provision of the Clean Water

1 Act, a founding principle, is the national goal of eliminating
2 the discharge of all pollutants to our waters. I think we
3 missed that 1985 deadline, too. This goal is why we have the
4 National Pollutant Discharge Elimination System and the
5 technology-forcing requirements that we will be discussing
6 over the next few days.

7 TDEC's flawed BPJ analysis did not fulfill
8 its legal obligations. As the evidence will show, TDEC did
9 not conduct a BPJ analysis or set BAT limits. Instead, TDEC
10 inserted something it called a BPJ analysis in the final
11 permit, but this was little more than an effort to justify the
12 continued use of Bull Run's unlined settling ponds.

13 Early in his review, the permit writer
14 sent an email to an official at EPA stating, "I'm trying to
15 address the comments and response for BPJ permit limits; in
16 essence, a discussion as to why Tennessee will not and cannot
17 set numeric metal limits in advance of EPA's revised ELGs."

18 As the evidence will show, TDEC's analysis
19 was deeply flawed for two key reasons.

20 First, TDEC did not evaluate any treatment
21 technologies other than settling ponds. As a result, it did
22 not evaluate the relative effectiveness or affordability of
23 more advanced treatment options.

24 Second, TDEC assumed there was not enough
25 data for it to do a BPJ analysis, but it did not take any

1 significant effort to obtain this data. In fact, TDEC did not
2 even require TVA to provide information about Bull Run's
3 untreated scrubber wastewater. Not surprisingly, TDEC's
4 conclusion in the final permit was that it was infeasible to
5 set BAT limits, and so it did not do so.

6 However, as the evidence will show, it is
7 feasible and, therefore, mandatory for TDEC to develop numeric
8 BAT limits on toxics discharged from Outfall 001 at Bull Run.

9 Both Tennessee and EPA rules require that
10 effluent limits be imposed in numeric form when it's feasible
11 to do so.

12 Petitioners will present the testimony of
13 Dr. John Koon, a wastewater treatment expert, who will show
14 that other available technologies are far more effective than
15 settling ponds to reduce metals and total dissolved solids in
16 Bull Run's coal combustion wastewaters.

17 Dr. Koon will show you how he was able to
18 derive numeric BAT-based limits by evaluating more advanced
19 technologies than settling ponds. And I want to point out
20 here that TVA has already decided to close the settling ponds
21 at Bull Run. So it's really just a matter of time before
22 TDEC -- sorry, before TVA is going to need to install new
23 wastewater treatment.

24 Now, part of BAT is determining whether
25 treatment technologies are economically achievable, and here

1 TVA does not take the position in this Bull Run NPDES permit
2 appeal that TVA would be unable to pay the capital costs or
3 operating and maintenance expenses for physical treatment,
4 chemical precipitation, biological treatment, and
5 vapor-compression evaporation/crystallization.

6 TDEC did not fulfill its legal obligation
7 to impose BAT limits by adding an open-ended best management
8 practices provision to the final permit.

9 Even if TDEC were allowed to impose a BMP
10 requirement instead of a numeric limit in this case, which it
11 is not, this permit's BMP provision is woefully deficient on
12 several counts.

13 First, the BMP provision is based on
14 continued operations of Bull Run's unlined ponds. These ponds
15 are patently not BAT for coal ash wastewaters and,
16 particularly, not for Bull Run's high test scrubber
17 wastewater.

18 Second, the BMP provision does nothing to
19 control or abate the discharge of pollutants. In fact, all of
20 the parties agree that there is no pollutant concentration or
21 discharge that would constitute a violation of this BMP
22 provision. How can this be the right way for TDEC to protect
23 Tennessee's rivers?

24 Finally, the parties have done our best to
25 streamline this hearing in order to be respectful of your

1 time. We've worked together to submit joint exhibits, which
2 are excerpted in the binders in front of you. We've provided
3 stipulations establishing a number of important but
4 uncontested facts. And to facilitate your review, we've also
5 provided a separate binder with copies of all of the
6 applicable statutes and regulations.

7 The parties have also agreed to rely upon
8 affidavits of members of the Tennessee Clean Water Network and
9 the Southern Alliance for Clean Energy instead of spending
10 several hours of your time having them come here to testify in
11 person.

12 As you heard, the threshold question of
13 whether petitioners can appeal this permit has already been
14 resolved. But I do want this Board to know that petitioners
15 have members who live, work, and recreate in and near the
16 Clinch River downstream from Bull Run. These organizations
17 have many more members who care about water quality in the
18 Clinch River and who want TDEC to ensure that TVA power plants
19 meet the level of pollution control required by law.

20 In conclusion, I would refer this Board,
21 once again, to the Kentucky decision from last month in which
22 Judge Shepard opined, "The Court finds it implausible that in
23 1982 the EPA concluded that setting technology-based limits
24 for these toxic pollutants was unnecessary and meant to
25 totally suspend all efforts to decrease discharge of these

1 pollutants."

2 Addressing precisely the same issues that
3 apply to Bull Run, Judge Shepard held that Kentucky is
4 required to conduct a BPJ analysis before issuing the permit
5 and that such analysis is not discretionary. Judge Shepard
6 concluded, "The Court recognizes that this ruling may be
7 superseded by a forthcoming EPA ruling applicable to scrubber
8 wastewater. Nevertheless, this does not relieve the Cabinet
9 from complying with its obligations under the Clean Water
10 Act."

11 In this case, petitioners ask the Board to
12 follow the lead of our sister state and to fulfill TDEC's
13 legal obligation to protect Tennessee's precious waters.

14 And, specifically, petitioners ask this
15 Board to find:

16 First, the Tennessee Water Quality Control
17 Act requires TDEC to conduct a case-by-case BPJ analysis to
18 develop BAT limits on toxics at Bull Run Outfall 001.

19 Second, TDEC did not conduct the
20 legally-required BPJ analysis or develop BAT limits for this
21 permit.

22 Third, it is feasible and, therefore,
23 mandatory for TDEC to develop numeric effluent limits on
24 toxics discharged from Outfall 001 at Bull Run.

25 Fourth, TDEC did not fulfill its legal

1 obligation to impose BAT limits by adding an open-ended best
2 management practices provision to the final permit.

3 Accordingly, petitioners respectfully
4 request this Board to find that the permit does not comply
5 with the Tennessee Water Quality Control Act and to remand the
6 permit back to TDEC with instructions to conduct a proper BPJ
7 analysis, set appropriate BAT limits on toxics, and reissue
8 the permit expeditiously.

9 Members of the Board, Judge Summers, thank
10 you.

11 MR. PARKER: Mr. Chair and Members of the
12 Board, I appreciate you being here today. Most of you know
13 me. My name is Patrick Parker, and I'm in the Office of
14 General Counsel here at TDEC. I along with Austin Payne are
15 representing the Department in this matter.

16 Most of you are familiar with Vojin
17 Janjic. He is sitting next to me. Mr. Janjic is the manager
18 of the water-based systems section of the division of water
19 resources. That is the section which writes NPDES permits for
20 discharges to surface waters which are covered by the
21 Tennessee Water Quality Control Act.

22 Our position in this matter is that the
23 permit in question here complies with all the legal
24 requirements which are applicable to the discharges for which
25 it covers.

1 To point out, the permit has numeric
2 limits for pH, TSS, and oil and grease. It also has WET tests
3 for coal/oak effluent toxicity testing provisions, which
4 require the permittee to test their wastewater on the various
5 two types minimum. It also has the standard provision, no
6 toxics to mount as part of the effluent limitations.

7 It is TDEC's position that the 1982
8 effluent limitation guidelines, or ELGs, considered the waste
9 stream at question here, and EPA decided not to promulgate
10 numeric limitations.

11 We have reviewed the development documents
12 from the 1974 to 1982. They indicate that EPA did evaluate a
13 considerable amount of wastewater effluent metals data when
14 developing the steam electric ELG.

15 EPA looked at the metals at issue here and
16 described them as not being present in significant amounts.
17 EPA opted not to set BAT limits for these pollutants, citing
18 that the limited amount of data on reductions was not
19 sufficient to support national limitations. EPA also
20 determined that the high cost of retrofitting did not justify
21 additional pollutant reductions.

22 At issue here are discharges from the flue
23 gas desulfurization, or FGD, scrubbers. These were covered in
24 the definition of low volume waste, which were considered in
25 the 1982 ELGs. You can see that here in the definition of low

1 volume waste in the development document.

2 As you can read, low volume waste sources
3 included, but are not limited to, wastewaters from wet
4 scrubber air pollution control systems. They're specific to
5 this case, they're applicable, and they're existing
6 EPA-considered.

7 Now, let's look at what the actual rule,
8 40 CFR 125.3 says. It says, technology-based treatment
9 requirements may be imposed through one of the following three
10 methods, and this was the same slide or same portion of the
11 rule that Ms. Matheny put up there. It says, to the extent
12 that EPA-promulgated effluent limitations are not applicable.
13 That is not the case here. We have applicable limitations.

14 What do the Board's regulations say about
15 industrial technology-based effluent limitations? It says --
16 it simplifies it. But it says, for industrial dischargers
17 with applicable effluent limitations, technology-based
18 effluent limitations, in accordance with those guidelines,
19 shall be applied. It's not a "may" or "might". And it says,
20 without applicable effluent limitation guidelines, that BPJ
21 should be used to employ to determine appropriate effluent
22 limitations.

23 The NPDES Permit Writers' Manual states
24 that prior to establishing BPJ-based limits for a pollutant
25 not regulated in an effluent guideline, permit writers should

1 ensure that the pollutant was not considered by EPA when
2 developing the ELGs.

3 What are these ELGs? They are developed
4 by the federal government to establish a definitive standard
5 as to what level various industrial segments must treat their
6 wastewater, absent a water quality issue. Then you look at
7 the ELGs, and you determine what was considered.

8 As I showed you before, wet air scrubber
9 pollution devices were considered in the 1982 ELGs. If they
10 were evaluated and considered, then those ELGs are applicable.
11 If not, we have to do more work.

12 The development documents applicable to
13 this discharge clearly indicate that they were considered by
14 EPA but not incorporated into numeric ELGs for the reasons
15 I've stated previously. So what that means is that there is
16 no legal basis to regulate other pollutants absent a water
17 quality based problem.

18 In this case, TDEC issued a draft permit
19 with no BPJ-BAT analysis. The petitioners commented that such
20 analysis was necessary. EPA, when sent the draft permit,
21 which was part of our MOU with EPA, did not even mention the
22 lack of analysis was at issue in the comments on the Bull Run
23 draft permit.

24 Because of the petitioners' comments, TDEC
25 went through a discretionary BPJ analysis in the way that is

1 required under 40 CF 125.3, and these are the factors you
2 consider when you do this analysis. And the proof will show
3 that we went through each one of these and concluded that we
4 cannot set numeric-based effluent limit BAT.

5 TDEC found that establishing numeric
6 effluent limits was infeasible to the amount of data available
7 at that time. As a result of going through that process, TDEC
8 placed narrative effluent limits as a way of achieving the
9 best quality effluent discharging from the treatment ponds.
10 EPA did not object to the permit as it was issued, as would be
11 the case if they had any problems with the legal basis of the
12 permit.

13 Those narrative limits are in the form of
14 best management practices. The Board is fairly familiar with
15 this. We use these in our construction of stormwater, and we
16 also use these for various other types of permits.

17 TVA was required to submit its best
18 management plan to the division. The plan must establish
19 controls to address metals in the effluent. TVA has submitted
20 these, and the division has approved the plan. These types of
21 narrative limits are a normal way of creating effluent limits
22 when numeric limits are infeasible to set.

23 One of the most important things that you
24 must understand is that TVA's FGD scrubber is fundamentally
25 different. And it's not only at Bull Run, but it's the ones

1 that they have at some other plants, from the vast majority of
2 scrubbers in the industry.

3 TVA has once-through scrubbers as opposed
4 to recycling scrubbers. And, in essence, what it is, as I
5 explained to my son last week, it would be like if you took a
6 shower, where you just kept using the bath water again and
7 again to wash. Well, the dirt would build up. In TVA's case
8 it's like we do when we take a shower. The water goes down
9 the drain. The result of this is that pollutant
10 concentrations are significantly lower than those in recycle
11 scrubbers wastewater. This leads to a weak waste stream.

12 Another important take-away from this is
13 that the amount of data for once-through scrubbers, as
14 compared to recycled scrubbers, which is the main technology
15 used in the industry, is vastly lower. At the time we issued
16 this permit, we had almost no data in order to establish
17 treatability-based limitation in this permit cycle. Thus,
18 establishing such limits in a BPJ-BAT analysis was infeasible.

19 TDEC addressed this data vacuum by
20 requiring extensive effluent monitoring requirements for a
21 suite of metals, which will help establish those limitations
22 in the future.

23 It is important to note EPA is
24 currently -- as Ms. Matheny pointed out -- in the process of
25 rewriting the existing ELGs. They are currently out in draft,

1 and they have submitted comments. TDEC submitted comments
2 through a national organization, Pollution Control
3 Administrators, and we submitted those comments to EPA. This
4 happened this summer.

5 There are various options or limitations
6 within these draft guidelines. The draft guidelines also have
7 limitations as far as the data that they can use on
8 once-through scrubbers. It's important to everyone that EPA
9 set these national guidelines. The reason for that is because
10 what national guidelines do is create a level playing field
11 for the industry as a whole.

12 If TDEC or any state tried to override any
13 existing and applicable set of ELGs, it would effectively
14 create what is not intended by the Clean Water Act, which is
15 to create an uneven playing field. That would result in
16 economic consequences to the state and permittee. The current
17 court-ordered deadline to issue final ELGs is May 2014.

18 What the proof will show -- and TVA will
19 get into this more -- is that the existing pond structure is
20 at Bull Run BAT.

21 What this case is absolutely not about is
22 the water quality impact from this discharge. TDEC is
23 required to ensure that our water quality standards are not
24 violated as a result of any discharge. For those board
25 members who are not very familiar with what a water quality

1 standard is, this is it in a nutshell. Every three years
2 Tennessee, as well as any other state, must establish criteria
3 that are both protective of human health and the environment.

4 This Board does that with the help of the
5 division. These are expressed as what we call water quality
6 criteria. They are both numeric and narrative. Pursuant to
7 the state Water Quality Control Act, TDEC cannot issue a
8 permit which would cause a violation of these criteria. We
9 assure this via the permit application process.

10 When TDEC receives a NPDES permit
11 application, that application has data on a set of pollutants
12 required by rule, which includes the one at issue in this
13 discharge.

14 The division does a reasonable potential
15 analysis to determine if it's necessary to limit any of those
16 pollutants in such a way to maintain water quality in
17 applicable standards. The result of that in this case is that
18 there was no reasonable potential to violate water quality
19 criteria. That was true at the time we issued the permit, and
20 it's true now when one looks at the monitoring data which has
21 been collected pursuant to the permit.

22 This chart, which we're trying to get up,
23 shows for the three parameters that are in the draft ELG,
24 which EPA has put out for public comment, what the
25 relationship is between water quality criteria, what was in

1 the application data, what the ash pond actually -- what this
2 effluent actually, over the past three years, has shown,
3 you'll note, that it's below water quality criteria in all
4 cases and what the reasonable potential is for that data to
5 cause water quality violations.

6 As you can see, this data set shows that
7 the Bull Run discharge end of pipe effluent concentrations are
8 actually below water quality criteria and that even if TVA
9 discharges significantly more concentrations, those would not
10 violate water quality criteria.

11 What you have before the Board is a permit
12 that is about to expire literally within the next couple of
13 weeks, a situation where the existing and applicable effluent
14 guidelines that are now legally required are in place, and
15 another set is about to issue in final form.

16 There are many reasons not to ask the
17 division to revise the permit, both practicable and legal.
18 However, the prevailing reason, as I said a bit ago, is that
19 this permit was issued in accordance with all legal
20 requirements applicable in this case. I trust that that will
21 be your finding here. Thank you.

22 MR. STAGG: Good morning. As I said
23 earlier, my name is Michael Stagg, and I'm an attorney here in
24 Nashville with the law firm of Waller, Lansden, Dortch &
25 Davis, and I'm here today representing the Tennessee Valley

1 Authority. TVA has participated in this hearing as an
2 intervenor, with full rights just as the parties have. TVA
3 intervened in this proceeding for obvious reasons, and that is
4 TDEC's permit that's at issue here today.

5 You met some of my co-counsel, both from
6 Waller and from TVA earlier. Also with us today is Sam
7 Hixson. He is an employee of TVA and its corporate
8 representative here today, and also Dr. Tom Higgins, who is an
9 expert witness in this proceeding and with the consulting firm
10 of CH2MHILL, and you'll hear testimony from both of those two
11 gentlemen.

12 TVA is a federal agency tasked by Congress
13 to advance the social and economic well-being of the Tennessee
14 River Valley. It maintains one of the largest electric power
15 systems in the United States. TVA's power system serves more
16 than nine million people in parts of seven states, including
17 almost all of Tennessee. Because TVA is a nonprofit
18 corporation, it receives no taxpayer or appropriated federal
19 dollars, and all of the expenses it incurs eventually are paid
20 by ratepayers.

21 The Bull Run plant that TVA operates in
22 Anderson County is one of the electricity-generating resources
23 on the TVA power system. To comply with the Federal Clean
24 Water Act and Clean Air Act and Tennessee's air pollution
25 control requirements, TVA has installed significant emission

1 control equipment at Bull Run, costing hundreds of millions of
2 dollars, including a limestone once-through scrubber, also
3 known as a flue gas desulfurization scrubber, or FGD system,
4 and it reduces sulfur dioxide emissions from the plant.

5 Discharges of water from this wet scrubber
6 are sent through three ponds for treatment: First, the
7 scrubber wastewater is sent to a gypsum disposal pond, which
8 is No. 2 on that slide, then to a settling pond, which is
9 No. 3, and finally to a stilling pond, which is No. 4.

10 During this pond treatment system process,
11 the scrubber discharge commingles with ash and other
12 wastewater streams for further treatment before being
13 discharged to the Clinch River. And No. 5 shows the
14 Outfall 001, which discharges from all of these ponds
15 collectively.

16 This whole system comprises Bull Run's
17 pond treatment system for wastewater discharges. The pond
18 treatment system does an exceptional job of treating the water
19 that is in Bull Run's discharges.

20 In issuing the permit, TDEC determined
21 there was no reasonable potential that Bull Run's discharges
22 would cause or contribute to a pollutant level above
23 Tennessee's water quality criteria. Saya Qualls, who was then
24 the chief engineer in TDEC's division of water resources,
25 explained, the effluent quality that we have observed at Bull

1 Run, based on the data that we have, demonstrates that there
2 are very low levels of pollutants that are discharged. It
3 would be difficult to discern a significant difference based
4 on different treatment technologies, because we're looking at
5 such, such low levels of most of the pollutants.

6 The design of Bull Run's once-through
7 scrubber creates a purge stream in which metals are
8 predominantly in particulate rather than dissolved form.
9 Particulate-form metals are effectively treated through the
10 physical process of settling and filtrating, which occurs in
11 the pond treatment system.

12 For example, selenium, a pollutant that
13 petitioners are very concerned about, is very effectively
14 removed by Bull Run's ponds. The Bull Run scrubber produces
15 selenium in its easiest-to-remove form, selenite rather than
16 selenate, and naturally occurring iron contributes also to the
17 effective removal of selenium.

18 In other words, the pollutants that are
19 produced by Bull Run's scrubber system are well-suited for
20 effective treatment in the pond treatment system.

21 In addition, Bull Run's pond treatment
22 system uses more than simple gravitational settling to treat
23 pollutants. The gypsum disposal area, which is area No. 2,
24 acts as a settling pond followed by a natural filtration
25 through gypsum. Additionally, a pH shift occurs between the

1 different components of the pond treatment system, which
2 results in the removal of a certain amount of dissolved
3 solids, as well as suspended particles.

4 As a result of Bull Run's pond treatment
5 system, virtually 100 percent of particulates and about 90
6 percent of all pollutants are removed prior to the discharge
7 into the Clinch River. Wastewater from the Bull Run plant
8 consistently meets and exceeds all applicable discharge
9 requirements and, in fact, typically contains chemical
10 contaminants in concentrations lower than those allowed
11 by the federal and state drinking water standards.

12 Petitioners bear the ultimate burden of
13 proof in this case, meaning that they must show by a
14 preponderance of the evidence that TDEC's decision to renew
15 the Bull Run permit violated a provision of the Tennessee
16 Water Quality Control Act. They cannot do so.

17 This appeal raises three questions for the
18 Board's consideration. Our view of these issues corresponds
19 closer to the petitioners. The three issues that I'm going to
20 raise correspond with Ms. Matheny's Nos. 2, 3, and 4 on her
21 list. If this Board answers any of these questions contrary
22 to petitioner's petition, TDEC's decision to renew the permit
23 must be upheld.

24 Before I get into these three arguments, I
25 wanted to respond briefly about the Kentucky decision that has

1 been mentioned. We will obviously talk more about that in
2 closing, but I just wanted you to have it in your mind. The
3 state agency in Kentucky did exactly what TDEC did. They did
4 not agree with the trial court. They did not set numeric --
5 the state agency didn't set numeric limits.

6 The trial court reversed it. It's on
7 appeal. Both the state and the utility have appealed that in
8 Kentucky. And it's not binding on Tennessee, and, in fact,
9 the Kentucky Regs at issue are different than the Tennessee
10 Regs. We'll talk more about that in closing, but I just
11 didn't want to leave it out.

12 The first issue that we believe we need to
13 address is, was TDEC correct in determining that an existing
14 effluent limitation guideline, or ELG, for power plants
15 applied to Bull Run and established the discharge limits
16 required to be set in the permit. If the Board determines
17 that EPA's ELG for power plants governs, a best professional
18 judgment analysis was not required, and petitioners lose this
19 appeal.

20 Second, if the Board determines that a BPJ
21 analysis was required, did TDEC consider the necessary
22 statutory and regulatory criteria in its BPJ analysis. If the
23 Board determines that TDEC did sufficiently consider the BPJ
24 criteria in its analysis, petitioners lose this appeal.

25 Third, was it proper for TDEC to conclude

1 through its BPJ analysis that it was appropriate to impose
2 best management practices and toxicity testing requirements
3 rather than numeric effluent limitations. If the Board
4 determines that TDEC was not required to set numeric effluent
5 limitations, then the petitioners lose their appeal.

6 As TDEC and TVA will show, none of these
7 dispositive questions can be answered in petitioners' favor.
8 EPA's existing ELG for power plants governs TDEC's actions
9 here, and TDEC properly applied that guideline. Even though
10 it was not required, TDEC did consider the criteria specified
11 for a BPJ analysis.

12 Further, best management practices,
13 especially when supplemented by the required use of toxicity
14 testing to confirm that aquatic species are not being harmed,
15 are permissible substitutes for numeric discharge limits.
16 There is no legal or environmental reason to overturn TDEC's
17 permit decision.

18 I'd like to elaborate on these three
19 issues before the Board. Tennessee law is clear that a BPJ
20 analysis is not required when an existing ELG does apply to
21 Bull Run. Therefore, TDEC does not have to undertake a BPJ
22 analysis in issuing the permit.

23 Existing ELGs do apply to Bull Run's waste
24 streams. Tennessee Rule 1200-4-5 is called Permits, Effluent
25 Limitations and Standards. Section -.09 of this rule

1 addresses technology-based effluent limitations. This rule
2 refers specifically to EPA's ELGs. It states, "Permits for
3 discharges will contain limitations and standards in
4 accordance with these guidelines, when such are in effect,
5 unless more stringent limits are necessary to maintain
6 designated uses."

7 In this case TDEC determined that there
8 was no reasonable potential that discharges from Bull Run
9 would cause or contribute to violations of Tennessee water
10 quality criteria. Therefore, there was no need to put more
11 stringent limits in the permit than what the ELGs required.

12 I'd like to focus on Tennessee regulations
13 that are applicable here. You did not hear about these from
14 the petitioners. They mentioned the 125(c)(3) regulation,
15 (c)(1),(2), and (3).

16 Here are Tennessee's corollary
17 regulations. Section (1)(b)(1) of the regulation, the rule
18 states, "For industrial discharges with applicable federal
19 effluent guidelines, technology-based effluent limitations and
20 standards in accordance with those guidelines shall be
21 applied." TDEC does not have discretion here. It must apply
22 the limitations in the ELG if the federal ELG applies.

23 Below that, section (1)(b)(2) provides
24 that a BPJ analysis shall be conducted when there is no ELG
25 applicable to an industry category. The Tennessee regulations

1 provide two choices. There's no BPJ analysis required when an
2 ELG applies to an industry category, and when there is no
3 applicable ELG for an industry, TDEC must undertake these
4 requirements. So the two Tennessee regulations are black and
5 white.

6 As you saw from earlier slides, the
7 federal rules mirror these requirements. The federal rule is
8 at 40 CFR 125.3, and it states in subsection (1)(c)(1) that
9 technology-based effluent limitations may be imposed through
10 application of EPA-promulgated effluent limitations developed
11 under section 304 of the Act to discharges by category or
12 subcategory. Those categories and subcategories referred to
13 are the effluent limitation guidelines. This covers the
14 situation in which an ELG for an industry exists.

15 Subsection(c)(2) governs when there is no
16 applicable ELG for an industrial category. There is no
17 dispute that EPA has issued an ELG for coal-fired power plants
18 like Bull Run.

19 In support of their claims -- and this is
20 key, we think -- petitioners rely on a mistaken interpretation
21 of the third option under section 125.3, and that's (c). That
22 section states, where promulgated effluent limitation
23 guidelines only apply to certain aspects of the discharger's
24 operation, or to certain pollutants, other aspects or
25 activities are subject to regulation on a case-by-case basis

1 in order to carry out the provisions of the Act.

2 Petitioners say this provision required
3 TDEC to impose numeric limits in the permit for metals, but we
4 think they're wrong.

5 First, if you look closely at the
6 language, this section does not require regulation of a
7 pollutant; rather, it gives the permit writer discretion to
8 regulate other aspects or activities on a case-by-case basis.

9 Second, Tennessee does not have a similar
10 provision in its regulations. And EPA, when it reviewed
11 Tennessee's NPDES program, did not require this provision to
12 be in the Tennessee regulations. TDEC and EPA regulations,
13 therefore, are consistent.

14 The case-by-case analysis that is allowed
15 by this federal rule is discretionary, and Tennessee could
16 appropriately choose not to include a provision for such a
17 discretionary analysis in its regulations.

18 When EPA approved Tennessee's NPDES
19 program, it approved the Tennessee corollary rules to EPA's
20 125.3 rules, and it concluded that the Tennessee rules were
21 sufficient to address the regulatory agency's voluntary
22 case-by-case BPJ analysis.

23 EPA has promulgated an ELG for the steam
24 electric power generating point source category. This
25 category applies to coal-fired power plants like Bull Run, and

1 this is not in dispute in this hearing.

2 One of the waste streams regulated by this
3 ELG is low volume waste sources, which are defined to include
4 wastewaters from wet scrubber air pollution control systems,
5 and it's on the slide that Mr. Parker projected. Low volume
6 wastes are a collection of wastewater streams from a variety
7 of plant processes, and they include ELGs in wastewaters.

8 Because Bull Run's scrubber wastewaters
9 are commingled and managed with other waste streams through
10 the pond treatment system, they are covered by the ELG
11 definition for low volume waste.

12 Thus, an existing ELG applies to the waste
13 streams discharged from Bull Run. Because an applicable ELG
14 governs Bull Run's discharges, TDEC properly determined that
15 it did not have to conduct a BPJ analysis. You'll hear
16 witnesses from TDEC testify on this point during the hearing.

17 Existing ELGs apply to the metals
18 discharged from Bull Run. Even though an ELG applies to Bull
19 Run's waste streams, petitioners want TDEC to go above and
20 beyond the requirements of that ELG. They claim that TDEC
21 must set limits in the permit for any pollutants not
22 specifically limited by the ELG, particularly metals.

23 It's true that the existing ELG does not
24 set specific numeric limits for certain metals, but this does
25 not mean that the ELG does not govern those metals. When EPA

1 was developing the ELG for coal-fired power plants, it
2 considered the metals at issue but determined that effluent
3 limits for those metals were not necessary.

4 According to EPA's Permit Writers' Manual,
5 this means that TDEC did not have to set BPJ-based effluent
6 limitations for these metals. EPA's manual states that
7 BPJ-based effluent limits are not required for pollutants that
8 were considered by EPA for regulation under the effluent
9 guidelines but for which EPA determined that no ELG was
10 necessary. Here TDEC properly determined that the ELG applies
11 to these metals, even though EPA did not set numeric effluent
12 limits for the metals.

13 When developing the existing steam
14 electric power generating point source category ELGs that
15 govern this case, EPA explained, "Even if this regulation does
16 not control a particular pollutant, the permit issuer may
17 still limit such pollutant on a case-by-case basis when
18 limitations are necessary to carry out the purposes of the
19 Act." This has been EPA's consistent position for three
20 decades, up until the Hanlon memo.

21 Finally, EPA's own conduct during the
22 permit renewal process also reinforces the conclusion that
23 TDEC acted properly and was not required to set specific
24 limits for metals. Once EPA approves a state's NPDES program,
25 EPA suspends its own authority to issue permits in that state.

1 Instead of directly issuing permits, EPA has the opportunity
2 to review permits that a state proposes to issue, and EPA can
3 veto a permit and issue the permit itself if the proposed
4 permit is, quote, "outside the guidelines and requirements" of
5 the Clean Water Act.

6 In Tennessee, a 2007 NPDES Memorandum of
7 Agreement with EPA Region 4 requires TDEC to provide EPA with
8 an opportunity to review draft and proposed NPDES permits.
9 When EPA does not respond to a draft permit, Tennessee, quote,
10 "may take this absence of response as concurrence with the
11 draft permit."

12 Here EPA did not include in its formal
13 comments on the draft permit any mention of any requirement
14 for a BPJ analysis. EPA concurred with TDEC's judgment that
15 specific limits for metals were not required.

16 The second issue; as I just explained,
17 TDEC did not have to do a BPJ analysis in this case. However,
18 in response to informal conversations with EPA Region 4 and
19 comments on the draft permit, including those by petitioner
20 Tennessee Clean Water Network, TDEC decided to voluntarily
21 conduct a BPJ analysis. As you will see, TDEC's BPJ analysis
22 considered all of the required statutory factors, in addition
23 to EPA's guidance documents.

24 TDEC and TVA will show that TDEC followed
25 all appropriate protocols for exercising its best professional

1 judgment and properly concluded that, first, Bull Run's pond
2 treatment system constitutes the best available technology
3 economically achievable and that a change to either a zero
4 liquid discharge of the physical/chemical/biological system
5 could be achieved only by expending significant amounts of
6 ratepayers' money for negligible environmental benefit.

7 The pond treatment system at Bull Run
8 qualifies as BAT. TDEC determined that for Bull Run, the pond
9 treatment system is acceptable. TVA's expert witness,
10 Dr. Higgins, agrees with this determination. Dr. Higgins
11 performed a detailed BPJ analysis himself and determined that
12 Bull Run's existing pond treatment system qualifies as BAT.

13 As he will explain, the treatment system
14 at Bull Run removes both suspended solid metals in particulate
15 form and dissolved metals. This system effectively prevents a
16 significant discharge of pollutants from Bull Run.

17 One of the alternative technologies is
18 call zero liquid discharge, and that is not BAT for Bull Run.
19 Petitioners claim that TDEC should have considered zero liquid
20 discharge as an alternative to Bull Run's settling pond
21 system. However, both EPA and TDEC have specifically rejected
22 ZLD as BAT for coal-fired power plants.

23 In issuing a draft permit for the
24 Merrimack facility in New Hampshire, EPA's Region 1 declined
25 to impose the ZLD technology. Instead, there they opted for a

1 physical, chemical, and biological treatment system.

2 EPA has further rejected the ZLD
3 technology in the draft ELG just recently published. It does
4 not include ZLD technology in any of the alternatives
5 considered for regulation.

6 Further, even assuming that ZLD is
7 technologically available for Bull Run, you'll hear testimony
8 that it is not cost-effective. Accordingly, there is no basis
9 to remand the case to TDEC to further consider whether to
10 require Bull Run to switch to a ZLD system.

11 Physical, chemical, and biological
12 treatment is also not BAT for Bull Run. Dr. Higgins will show
13 that a physical, chemical, biological treatment would not
14 achieve better treatment than Bull Run's pond treatment
15 system. While switching to this technology could result in
16 minor improvements for some pollutant parameters, it would do
17 so at an exorbitant cost.

18 The third key issue here, TDEC was not
19 required to set numeric TBELs, or technology-based effluent
20 limits, in the permit. As I mentioned earlier, as a result of
21 TDEC's BPJ analysis, TDEC imposed best management practices,
22 or BMPs, and monitoring requirements in the Bull Run permit
23 and continued the toxicity testing requirements from previous
24 permits.

25 As TDEC and TVA will show, the law

1 recognizes that these requirements are a proper, appropriate,
2 and lawful approach to regulating a facility's discharges.
3 TDEC's analysis and the permit are, therefore, in full
4 compliance with the Federal Clean Water Act and the Tennessee
5 Water Quality Control Act.

6 TDEC did imposed effluent limits for
7 metals discharges, just not in the numeric form that
8 petitioners prefer. The BMPs that were added to the Bull Run
9 permit are narrative effluent limitations, and they are
10 appropriate for regulating particular waste discharges and
11 effluent in circumstances where deriving numeric effluent
12 limitations is infeasible.

13 In this case, TDEC concluded that
14 establishing numeric limits was infeasible. Because of the
15 limited number of data points available for Bull Run's
16 discharge, TDEC determined that it could not accurately
17 develop permit limits based on effluent variability.

18 Because it was infeasible to calculate
19 numeric effluent limitations in this circumstance, TDEC
20 determined that BMPs were the only regulatory mechanism
21 available.

22 Finally, EPA approved the draft Bull Run
23 permit, which contained no numeric effluent limits for metals,
24 and EPA did not object to the lack of such numeric limits.
25 EPA deferred to TDEC's judgment and concurred in the issuance

1 of the permit without numeric effluent limits but with
2 narrative effluent limits in the form of BMPs for metals.
3 Thus, TDEC's imposition of BMPs was in compliance with the
4 Clean Water Act and the Tennessee Water Quality Control Act.

5 TDEC also appropriately and lawfully
6 imposed monitoring requirements. Both the courts and EPA have
7 recognized the propriety of imposing monitoring requirements
8 in NPDES permits. The D.C. Circuit Court of Appeals, which
9 hears a great deal of EPA cases, explained, quote, "It may be
10 appropriate in certain circumstances for a permit writer to
11 require a permittee simply to monitor and report effluent
12 levels." That's the D.C. Circuit Court opinion it came from.

13 EPA's regulations expressly allow this
14 approach. EPA includes monitoring only in some permits, and
15 EPA decisions approve the monitoring option. Accordingly,
16 TDEC's imposition of monitoring requirements for more than a
17 dozen different parameters was in compliance with the Federal
18 Clean Water Act and the Tennessee Water Quality Control Act.

19 TDEC also appropriately and lawfully
20 imposed toxicity testing. EPA's regulations provide that BPJ
21 limits may be expressed, where appropriate, in terms of
22 toxicity. When it comes to setting toxicity thresholds,
23 states retain considerable discretion under the Clean Water
24 Act.

25 In issuing the Bull Run permit, TDEC used

1 its discretion to impose toxicity limits and to require Whole
2 Effluent Toxicity, or WET, testing at Bull Run, which provides
3 an additional layer of protection over and above permit limits
4 on individual parameters.

5 In imposing toxicity limits and requiring
6 WET testing, TDEC lawfully and appropriately exercised its
7 discretion to limit TVA's pollutant discharges and to protect
8 the water quality in the Clinch River.

9 Any one of these three issues may be
10 dispositive in this case. As we proceed through the hearing,
11 I would ask that you keep in mind these three questions and
12 remember that if the Board rules against petitioners on any
13 one of these three questions, then the permit should be
14 upheld.

15 First, was TDEC correct in determining
16 that an existing effluent limitation guideline for power
17 plants applies to Bull Run and establishes the discharge
18 limits required to be set in the permit? If the Board finds
19 that TDEC was correct on this threshold legal issue, TDEC was
20 not required to exercise best professional judgment analysis,
21 and petitioners lose the appeal.

22 Second, if the Board determines that a BPJ
23 analysis was required, then was TDEC's consideration of the
24 statutory and regulatory criteria of a BPJ analysis
25 sufficient? If the Board determines that TDEC did

1 sufficiently consider the BPJ criteria in the analysis it
2 conducted, nothing further was needed to reissue the permit,
3 and the petitioners lose the appeal.

4 Third, was it proper for TDEC to conclude
5 through its BPJ analysis that imposing best management
6 practices and toxicity testing requirements, rather than
7 numeric effluent limits, in the permit was appropriate? Once
8 again, if the Board determines that TDEC was not required to
9 set numeric effluent limitations, the petitioners lose the
10 appeal.

11 There are also two policy reasons to deny
12 this appeal, in addition to these three statutory and
13 regulatory reasons. First, if you find that TDEC was required
14 to do a BPJ analysis, and if you find that that BPJ analysis
15 TDEC performed during the permitting process was flawed or
16 insufficient, one option for TDEC is to ask TVA, as the
17 regulated entity, to provide a BPJ analysis for TDEC's
18 consideration.

19 However, TVA has already done that. TVA
20 retained the foremost expert in the country to conduct a BPJ
21 analysis. Dr. Tom Higgins of the CH2MHILL consulting firm
22 performed an extensive study and prepared a voluminous report
23 for this appeal, which involved performing a BPJ analysis
24 following EPA's guidelines. Dr. Higgins concluded that TDEC
25 reached the correct conclusion in its BPJ analysis.

1 Dr. Higgins concluded that Bull Run's pond treatment system is
2 BAT for the FGD scrubber wastewater, and alternative
3 technologies are not BAT.

4 The second policy reason is that EPA has
5 proposed revised effluent guidelines for power plants just in
6 June. These draft ELGs are required by a court order to be
7 finalized by May 22nd, 2014. These ELGs will establish what
8 TDEC must consider and what TDEC must require power plants to
9 do going forward.

10 The permit before you expires in 17 days.
11 TDEC has in its possession TVA's renewal application. And if
12 it's not already, it will be considering renewal soon.

13 In addition, by consent order on an Air
14 Act case in federal court, TVA has agreed to apply to be
15 covered by the new ELGs within one year of finality, which is
16 a much faster compliance schedule than even EPA requires as
17 proposed in the draft ELGs. Tennessee is a party to that
18 agreement as well and has the capacity to enforce that EPA.

19 If this Board were to direct TDEC to set
20 numeric effluent limits for Bull Run, TDEC would be preempted
21 from considering and applying the revised guidelines that are
22 going to be final next May. This could result in a costly
23 waste of public resources, both those of TDEC and TVA. And if
24 the measures that TVA is required to take in response to
25 petitioners' appeal turn out to be inconsistent with the

1 revised EPA guidelines, then that is a hardship on TDEC, TVA,
2 and others.

3 EPA has declined to set a requested BPJ
4 limit for the discharge of pollutants in just this type of
5 situation, that is, if the issuance of the final ELG is
6 imminent, EPA has held up its permitting decisions.

7 A federal court of appeals upheld EPA's
8 decision to do this, stating, quote, "Some special latitude is
9 in order because of the agency's interest in coordinating the
10 standards in this permit with evolving national standards."

11 And that's exactly the situation we have
12 here, a permit that's about to expire, new national standards
13 about to be released, and EPA and the federal court have said
14 it's okay if the permitting agency withholds renewal of that
15 permit until the new national standards are released.

16 These two policy considerations are
17 additional reasons why this Board should reject petitioners'
18 permit appeal in its entirety.

19 TDEC issued this permit correctly. In
20 issuing the permit, TDEC was not required to perform a best
21 professional judgment analysis. It did so voluntarily and
22 correctly concluded that Bull Run's existing pond treatment
23 system is acceptable. Dr. Higgins confirmed TDEC's conclusion
24 through his own BPJ analysis. The Board should uphold TDEC's
25 permitting decision and deny the petitioners' appeal. Thank

1 you.

2 MS. MATHENY: Members of the Board, the
3 Tennessee Water Quality Control Act requires TDEC to follow
4 EPA's regulations, and I've already shown you that. Your
5 rules also require that.

6 And, forgive me, I don't have a slide for
7 this yet. But if you look under tab 8 of the smaller binder
8 on page 9 at the bottom, Rule 1200-04-05-.04 provides that no
9 permit shall be issued authorizing any of the following
10 discharges: When the conditions of the permit do not provide
11 for compliance with the applicable requirements of either the
12 Federal Clean Water Act or the Tennessee Water Quality Control
13 Act.

14 Failure to impose limits on toxics that
15 these limits would be required by applicable federal statutes
16 and regulations is less stringent and violates the Tennessee
17 Water Quality Control Act.

18 In this case, Tennessee rules can and must
19 be interpreted to be consistent with federal requirements.
20 And, in fact, TDEC's practice in other NPDES permits is to
21 oppose BPJ limits of the facility for federal ELGs apply to
22 some but not all wastewater streams.

23 Both TVA and TDEC pointed out to the fact
24 that EPA did not object to this permit. This very same rule
25 has a separate requirement that TDEC can't issue a permit when

1 EPA objects, but these are two separate requirements. This
2 Board has a separate duty to make sure the permit complies
3 with the federal requirement, in addition to whether or not
4 EPA objects.

5 And, in fact, the evidence will show that
6 EPA did not concur with TDEC's failure to follow the law in
7 this case. Objection by EPA to a permit is both entirely
8 discretionary and vanishingly rare. In fact, as far as I was
9 able to tell, pursuant to a former request to EPA, EPA has
10 never objected to a Tennessee permit.

11 Both TDEC and TVA referred to the NPDES
12 Permit Writers' Manual. The first thing I need to point out
13 about that manual is that it is not law. It is an
14 interpretation of law. It is guidance only. The Kentucky
15 court that I referred to earlier addressed this very same
16 argument about the Permit Writers' Manual and expressly
17 rejected it, and binding reliance on that language was
18 arbitrary.

19 Because in this case, as I showed you
20 before, the pollutants and wastewaters at issue here were not
21 considered by EPA but, instead, were explicitly excluded due
22 to insufficient technology some 30 years ago.

23 The evidence will show that technologies
24 have developed in the past 30 years. And as you've already
25 seen, Bull Run's untreated scrubber wastewaters have high

1 concentrations of toxic pollutants.

2 Mr. Stagg referred to the best
3 professional judgment rule, and he added a little bit of
4 language to Tennessee's rule. Under the same tab, page 26, at
5 the very top of that page, (b)(2), when Mr. Stagg read this
6 rule, he added language about it applying to an industrial
7 category under part 2. What your rule says is for industrial
8 discharges.

9 So while there's no dispute that the ELG
10 applies to the industrial category, what petitioners will show
11 is that it does not apply to the industrial dischargers that
12 we are talking about in this hearing.

13 Both TDEC and TVA referred to the ponds as
14 BAT. This assertion ignores the fact that TVA has already
15 decided to close these ponds and, in fact, has said that it
16 will do so, regardless of what rule EPA eventually comes up
17 with, and is doing so, in part, in response to the disastrous
18 Kingston spill, of which we are all very familiar.

19 These unlined settling ponds pose a
20 significant risk to the environment, because they are
21 partially built on coal ash, they seep, and they might
22 eventually fail. Because TVA has already decided to close
23 these down, I don't think it is proper to consider them
24 available technologies for Bull Run.

25 There is some emphasis on the distinction

1 between a once-through and a recycled scrubber. While it is
2 important, what's important to manage is the total loading of
3 pollutants discharged from the scrubber wastewater. Whether
4 you have a high volume, lower concentration waste stream,
5 typical of a once-through scrubber, or a low volume, higher
6 concentration waste stream typical of a recycled scrubber,
7 what matters is the total amount of pollutants that reach our
8 waters.

9 EPA's draft effluent limitations
10 guideline, in fact, does not distinguish between once-through
11 and recycled scrubbers. However, if you take TVA's testimony
12 at face value and find that these scrubbers are unique to the
13 industry, then it is all the more important for TDEC to take
14 the lead in regulating the dischargers from these scrubbers on
15 a site-specific basis rather than leaving that for EPA's
16 possible future rulemaking.

17 In fact, we expect that you will hear that
18 TDEC believes that if the ELG does not make this distinction,
19 it would not apply to Bull Run. While petitioners do not
20 necessarily agree, that is yet another reason TDEC cannot sit
21 on its hands and wait for EPA to fix this problem.

22 Moreover, the data TDEC is requiring TVA to
23 collect, the dischargers of the mixed waste outfall will not
24 allow TDEC to set limits for the scrubber wastewater. TDEC
25 still is not requiring TVA to gather the data necessary to

1 further characterize the scrubber wastewater at Bull Run.

2 Finally, Mr. Stagg referred to
3 Dr. Higgins' best professional judgment analysis regarding the
4 pond.

5 First of all, the evidence will show that
6 TVA's claim that the ponds treat over 90 percent of the
7 dissolved toxic metals is not based on actual metric data but
8 rather on a set of assumptions and calculations.

9 But, again, Dr. Higgins is, in fact, an
10 esteemed expert, but his analysis ignores the critical fact
11 that TVA has decided to close its ponds. Those ponds are
12 going away. And as they go away, as we will see, they are
13 going to go away in sequence. One pond will be removed at a
14 time. So whatever magic is allegedly happening in these ponds
15 to remove solids is going to change over the next few years.

16 So in closing, petitioners again ask this
17 Board to find that TDEC must impose BPJ-based BAT limits,
18 because the toxic pollutants at issue in this case were
19 expressly excluded from the 1982 ELGs, and we ask you to do
20 this because Tennessee waters are precious to all of us.

21 Thank you.

22 ADMINISTRATIVE JUDGE: Mr. Chairman, how
23 would you like to proceed at this point?

24 THE CHAIRMAN: I think we'll take a lunch
25 break and be back in an hour.

1 ADMINISTRATIVE JUDGE: All right. It's
2 11:46. We'll see you all in an hour. Thank you. We will be
3 in recess.

4 (Lunch recess taken.)

5 (BY THE ADMINISTRATIVE JUDGE) Okay. We
6 are back on the record after our lunch recess. The Board has
7 agreed to continue until five o'clock this evening. And in
8 order to avoid or to hinder the mad dash for the door at the
9 end of the day, Mr. Chairman, do you all have a preference for
10 what time we start again in the morning?

11 THE CHAIRMAN: We will start at 9:00.

12 ADMINISTRATIVE JUDGE: Okay. Now we're
13 commencing our witnesses' testimony -- and you will be charged
14 on this at the end of the testimony.

15 But just to give you a heads-up as we
16 begin, you will hear testimony from the witnesses, their
17 opinion of how to interpret the laws at issue, and that will
18 be their opinion with respect to the decisions that they made
19 with respect to the permit. But it is not in any way intended
20 to infringe upon the prerogative of the Board to make the
21 ultimate decision about the interpretation of the law.

22 So with that admonishment, petitioners can
23 begin with their first witness.

24 MS. LEE: Thank you, Your Honor. Good
25 afternoon, Mr. Chairman, Members of the Board. Thank you for

1 being here today. Before we get started with the witnesses,
2 the parties would like to jointly move to have the exhibits
3 identified in this case moved into evidence.

4 ADMINISTRATIVE JUDGE: So we have 97
5 exhibits and then 45 demonstrative exhibits; correct?

6 MS. LEE: That's correct, Your Honor.

7 ADMINISTRATIVE JUDGE: And we intend for
8 all of them to be entered as they are currently marked?

9 MS. LEE: Yes, Your Honor.

10 ADMINISTRATIVE JUDGE: Okay, motion
11 granted. We will have in evidence, then, 97 exhibits and 45
12 demonstrative exhibits. Now, are they already marked, or will
13 the court reporter need to mark them as they're discussed?

14 MS. WHITTLE: Your Honor, they're in the
15 binders. We don't have exhibit stickers on them, Your Honor.

16 MS. LEE: Not all the exhibits are
17 included in the binders.

18 ADMINISTRATIVE JUDGE: Okay.

19 MS. WHITTLE: The binder (inaudible).

20 ADMINISTRATIVE JUDGE: Say that again.

21 MS. WHITTLE: The binder discussed is not
22 the entire group of exhibits. I think maybe another binder is
23 there.

24 MR. PARKER: We just identified documents
25 that we thought the Board would need to look at and probably

1 will be testified about so that they would be in front of you
2 so we wouldn't have to give you three binders.

3 MS. WHITTLE: So, for example, if there's
4 a 400-page document, we put in three or four pages we actually
5 needed from the binder instead of giving you the entire
6 binder.

7 ADMINISTRATIVE JUDGE: So how are we going
8 to do the full exhibit then? And those have or have not been
9 marked?

10 MR. STAGG: There are two boxes that have
11 a full set of exhibits copied double-sided, and those will be
12 the official record sets. The books are --

13 MS. WHITTLE: And those exhibits are
14 tabbed, Your Honor, but they do not have exhibit stickers on
15 them.

16 ADMINISTRATIVE JUDGE: Okay. Well, I
17 mean, as long as they're --

18 MS. WHITTLE: Identified?

19 ADMINISTRATIVE JUDGE: Right. Okay, very
20 good.

21 (Exhibits 1-97 and
22 Demonstrative Exhibits
23 1-45 were pre-marked &
24 received into evidence
25 at this time.)

1 MS. LEE: Thank you again. Good
2 afternoon. My name is Bridget Lee, and I'm an attorney with
3 Earthjustice here on behalf of the petitioners. And as our
4 first witness, the petitioners would call Sam Hixson.

5 ADMINISTRATIVE JUDGE: You can have a seat
6 over here. If you would, before having a seat, raise your
7 right hand.

8

9

10 **SAM HIXSON,**
11 having been first duly sworn, was examined and testified as
12 follows:

13 **DIRECT EXAMINATION**

14 **BY MS. LEE:**

15 Q. Good afternoon, Mr. Hixson. Thank you for joining
16 us this afternoon. Could you please state your name for the
17 record.

18 A. Sam Hixson.

19 Q. And where do you work?

20 A. TVA.

21 Q. And what's your current position at TVA?

22 A. Current position is regulatory manager for waste.

23 Q. How long have you held that position?

24 A. Since the end of February 2012.

25 Q. And if you could just describe for the Board
generally what kind of work your job entails.

1 A. Currently my job entails solid waste permits,
2 hazardous waste determinations.

3 Q. Anything else?

4 A. Anything along those lines.

5 Q. And in this position, do you have responsibility
6 with respect to the Bull Run Fossil Plant?

7 A. For solid waste, yes.

8 Q. And what was your position prior to working in the
9 waste department?

10 A. I was water specialist from September 2009 to
11 February 2012.

12 Q. What kind of work did you do as a water
13 specialist?

14 A. As a water specialist, I was responsible for NPDES
15 permit applications, day-to-day advice to the plant.

16 Q. And in that role, did you have responsibilities
17 with regard to the Bull Run plant?

18 A. Yes.

19 Q. Could you describe those, please?

20 A. The permit application had already been filed. So
21 at the time, we were beginning negotiations on the permit,
22 provided information to the State as they requested.

23 Q. Did you participate in commenting on the draft
24 permit?

25 A. Yes, I did.

1 Q. Did you provide TDEC with any information they
2 needed as they went along with their permitting process?

3 A. Yes, I did. They asked for additional data that
4 we had. They asked us to plot that data in charts to provide
5 to them in Excel spreadsheets. They asked for several aerial
6 photos and distinguish what each pond was. They asked for low
7 level mercury analysis in the Clinch River, and we arranged
8 for that to be done.

9 Q. Are you familiar with how the Bull Run plant
10 operates?

11 A. Yes, I am.

12 Q. And does TVA operate a flue gas desulfurization
13 system also known as an FGD scrubber at Bull Run?

14 A. Yes. It was installed and started operating in
15 2008.

16 Q. What's the purpose of an FGD scrubber?

17 A. The FGD scrubber was put in to meet the air
18 pollution regulations, to reduce the sulfur dioxide going out,
19 which is called acid rain.

20 Q. Can you describe in just general terms how that
21 scrubber works?

22 A. Yes. I'll go back to Patrick Parker, the attorney
23 for the state's analogy, it's like a shower. But when you
24 look at the flue gas that's coming out of the plant, it goes
25 through a quench system where water is located to wet it. And

1 then it goes through another quench system where you mix your
2 limestone and water together, and you're injecting limestone
3 into your flue gas.

4 The limestone is calcium material. It will react
5 with the sulfur, forming calcium sulfate, which is your
6 gypsum, and that will drop out. We say it's a one-time cycle.
7 It's a once-through cycle. But actually the limestone
8 continues -- the slurry continues to be recycled until it is
9 physically used up, and we continue to add more.

10 At that point the gypsum in the bottom is slurry.
11 That is where you take the solids, and you have water in it to
12 push it out to our treatment system, where it goes through a
13 treatment pond, filtering through the gypsum and sand filter,
14 and then is discharged to the settling pond, which is No. 3 on
15 your picture here, and then comes into the stilling pond,
16 which is the last polishing pond that we have before it goes
17 out the outfall.

18 Q. And just so the Board can follow along,
19 Exhibit D-7 is included in that blue binder in front of you.
20 Mr. Hixson, how often does the scrubber operate?

21 A. Well, when the plant is operating, the scrubber
22 operates. So it depends on how often does the plant operate.

23 Q. So since September of 2010 when the permit was
24 issued, how often was the plant operating?

25 A. The plant -- and I'll use 2013, if that's all

1 right. In 2013 we have operated 61 days out of the year so
2 far. Bull Run is -- and in the previous year it would have
3 been in about the 20 to 30 percent range and so forth.

4 Q. So that's typical for your operation?

5 A. That's typical.

6 Q. And does the scrubber at Bull Run generate a waste
7 stream in addition to the gypsum you mentioned?

8 A. The gypsum waste stream, of course, will have the
9 calcium sulfate, your gypsum, but it will also have some
10 chlorides in it and some metals in it and probably a little
11 bit of antifreeze in it.

12 Q. And we could call that FGD wastewater or scrubber
13 wastewater or --

14 A. FGD wastewater would be fine.

15 Q. Or scrubber purge?

16 A. Or scrubber purge would be fine.

17 Q. So we're talking about the same thing?

18 A. Yes.

19 Q. Are there any other waste streams generated by the
20 plant and the scrubber?

21 A. That would be your primary waste stream coming
22 out.

23 Q. How about fly ash?

24 A. Fly ash is not generated by the scrubber.

25 Q. How is fly ash generated?

1 A. When you have a coal-fired facility like Bull Run,
2 you bring your coal in from your coal power right here. It's
3 brought in by conveyor to your plant. It's burned in the
4 boiler.

5 So imagine your fireplace at home. Imagine that
6 you've got steel on top of it, and you're heating something
7 up. It is burned in the boiler. Fly ash goes up through the
8 boiler, goes into an electrostatic precipitator where the fly
9 ash drops out as a dry material, and that is pneumatically
10 sent to one of two silos. And then that material is
11 transported by truck to the dry fly ash landfill, which was
12 permitted in 1992 when we started doing dry fly ash.

13 Q. Does the plant also produce bottom ash?

14 A. The plant also produces bottom ash. I'll go back
15 to my example where you have your boiler and your fire. The
16 bottom ash is typically your unburned or your large rock-like
17 material that comes out of the coal that's not completely
18 combusted.

19 Q. And does the plant have waste streams?

20 A. You would also have low volume waste from the
21 plant. You have your building sumps located inside the plant.
22 You may have a piece of equipment that is cooled and drained
23 to the building sump. You'd have your roof drains. You would
24 have your parking lot drains. You'd have your coal yard
25 runoff pond, and it's drained into this treatment system down

1 here.

2 Q. And I think you referred to this picture before,
3 but if you could just maybe talk us through -- you see there's
4 Nos. 1 through 5, what each of those is referring to.

5 A. All right. In our plant, the bottom ash is
6 dropped out right here where the No. 1 is pointing to.
7 There's a small shallow pond here. The bottom ash drops out
8 in the first 10 to 20 feet in that pond.

9 We then have a rip-wrap check dam to pond that
10 water up. We use a backhoe to take out the bottom ash. We
11 place it adjacent to that area right here. This is our
12 permitted bottom ash landfill, and we place it there. The
13 water continues on down the sluice ditch right here into the
14 settling pond, which is No. 3.

15 But before I go there with that, let's stay
16 numerically and go to No. 2. Let me go back a second. This
17 is hard-piped. We're not talking about ditches back up to the
18 plant. The only ditch that is there is the sluice channel
19 right here. Everything that comes out to there is hard-piped
20 from the plant.

21 The gypsum, which comes out of your FGD scrubber,
22 comes out hard-piped to this corner of the gypsum disposal
23 area. The gypsum drops out in, again, the first ten feet of
24 that area. And then you have water pooling up about 18 inches
25 or so in this end of that gypsum disposal area, and water then

1 filters through what gypsum has already settled out and then
2 through a sand filter and two French drains.

3 Imagine your water treatment plant where you get
4 your water from, it's the same concept. You have the water
5 treatment plant with like a French drain underneath it and
6 sand above it to filter your solids out, and that's what the
7 gypsum disposal area is designed to do. That water then comes
8 down and mixes with the bottom ash water, the other low volume
9 waste treatment sources, the building sump, the equipment
10 drains into this area here, allowing you for additional
11 settling time here, and it goes across a splitter dike between
12 this settling pond and the stilling pond, goes across a weir.
13 And then in the stilling pond, we have three turbidity
14 curtains.

15 Turbidity curtains would be -- imagine a boon
16 going across the water with a skirt on the bottom of it that
17 is made of polymer or a rubber material, and it makes the
18 water go under that so that you avoid short-circuiting in the
19 stilling pond. From there, after going past three turbidity
20 curtains, it goes out Outfall 001, Discharge 001, which is
21 No. 5, to the Clinch River.

22 Q. Thank you. Mr. Hixson, you mentioned the dry fly
23 ash now moved to silos in a landfill. Before that, the
24 conversion of the handling of fly ash to dry handling, where
25 was the fly ash?

1 A. Prior to 1992 it would have all come out into this
2 area right here. In 1992 we went dry except for when you
3 start up. And at the time we had difficulty being able to
4 take all of the fly ash at that time as dry, and some did get
5 sluiced between 1992 and December of 2010.

6 And in December of 2010 we added a second silo for
7 fly ash, and that eliminated the issue that we were having.
8 And so since December 2010, all fly ash is going to the
9 permitted landfill.

10 Q. And I believe you just described a little earlier
11 the scrubber wastewater, which is hard-piped down to the
12 corner of that gypsum disposal area at label No. 2. Could you
13 tell us if it's possible to sample that wastewater stream
14 before it enters disposal area No. 2?

15 A. You would sample right here at the pipe.

16 Q. Has TDEC ever requested a sample being taken at
17 that location?

18 A. No, ma'am.

19 Q. And has TVA itself ever sampled at that point?

20 A. As part of the process to look at waste treatment,
21 we have sampled.

22 Q. And when were those samples taken?

23 A. This past year, but I couldn't tell you the exact
24 date.

25 Q. Are you familiar with the characterization of Bull

1 Run wastewaters performed by HDR Engineering?

2 A. That study occurred after I had left as a water
3 specialist. I am familiar in that I know that it occurred,
4 but I didn't have access to all of the data, no.

5 Q. Are you familiar with the purpose of that study?

6 A. Yes.

7 Q. What was that?

8 A. The purpose of that study is to evaluate what type
9 of treatment will be used to replace our current treatment
10 pond system.

11 Q. And have you reviewed the February 2013 report
12 that HDR prepared following that study?

13 A. No, ma'am. Again, that is outside of the area
14 that I'm working now.

15 Q. Do you happen to know whether HDR took samples at
16 the point entering the gypsum pond?

17 A. No, I do not.

18 Q. I'm going to show you a page from that report,
19 just if you'll bear with me one moment. All right. This is
20 page 11 of your report, which has been entered into evidence
21 as Exhibit 60. Those pages are not included in the binder, so
22 if the Board would like to follow along on the screen.

23 Mr. Hixson, do you see just after the first
24 paragraph where it says samples are collected at the following
25 location?

1 A. Yes.

2 Q. And could you see item No. 6?

3 A. FGD absorber effluent. Grab samples were
4 collected at the discharge to the gypsum stack area.

5 Q. Thank you. Is the FGD absorber effluent, is that
6 the same as scrubber wastewater?

7 A. That is the same as scrubber wastewater.

8 Q. And is the gypsum stacking area the same area we
9 were discussing earlier that's No. 2?

10 A. Yes. If you went back to your aerial photo, it
11 would be the pipe going into -- the hard pipe coming up to
12 that gypsum disposal area.

13 Q. Thank you. Now, I know you're not familiar with
14 this report, so let me just jump to page 10, page 10 of the
15 report, table 3. You'll see it's labeled "wastewater flows".
16 This table presents various wastewater flows to the plant. Do
17 you see under description where FGD absorber effluent is
18 listed?

19 A. Yes.

20 Q. And to the right of that, the measured average is
21 listed as 349 gallons per minute?

22 A. That is correct.

23 Q. The measured average. And would 349 gallons per
24 minute convert to about .5 million gallons per day,
25 approximately?

1 A. I'll take your word on it.

2 Q. All right. I'm going to show you a schematic
3 diagram to the plant. Do you see this box here where it's
4 labeled "FGD system"?

5 A. Yes. But may I ask you to scroll down to the
6 bottom part of that just for a second, please?

7 Q. Sure.

8 A. Thank you. You can go back up now.

9 Q. Okay. Do you see an arrow going from that box to
10 the boxes that are labeled "dewatering facility" and "ash pond
11 gypsum stacking"?

12 A. Yes, I do.

13 Q. And above this arrow right here, do you see this
14 number?

15 A. .56.

16 Q. Does that number represent the flow from the
17 scrubber wastewater into the gypsum pond?

18 A. Into the gypsum disposal area, yes.

19 Q. Thank you. Over here on the left of the diagram
20 there's an arrow that says Outfall 001 with a number over it,
21 and could you read that number?

22 A. It looks like 15.097. It's a little fuzzy.

23 Q. I think it's 19.037.

24 A. All right.

25 Q. But would the numbers there represent the total

1 flow out of Outfall 001?

2 A. No.

3 Q. What would that number represent?

4 A. That would have been -- in 2007 that would have
5 been correct in that on startup you had to list the total flow
6 that would come through the fly ash on startup. Now,
7 remember, we were still using fly ash through the silo
8 pneumatically and taking it to the landfill. But on startup
9 you still had the potential for it to be sluiced out to the
10 settling pond No. 3.

11 So that figure includes the total flow, when in
12 2010 when we took out fly ash going to the settling pond, that
13 number would have dropped by six million gallons. So instead
14 of 19, it would have been around 13.

15 Q. Thank you. Now I'm going to show you a couple of
16 pages from TVA's 2012 environmental assessment for the bottom
17 ash and gypsum mechanical dewatering facility for Bull Run,
18 which has been identified as Exhibit 63. Just going back --
19 we'll just stick with this one moment. Could you tell us what
20 the normal operational flow would have been at that time?

21 A. Which year?

22 Q. In 2007.

23 A. In 2007 your operational flow could have ranged
24 from 13 million to as high as 19 million.

25 Q. This is page 31 from the environmental assessment

1 I just mentioned, Exhibit 63, table 3-3, which is included in
2 the binder behind tab 63. It's the last sheet. Mr. Hixson,
3 are you familiar with this environmental assessment?

4 A. Yes.

5 Q. And for this table, which is titled *Current inflow*
6 *of sources to the ash pond at Bull Run Fossil Plant*, could you
7 please read the third item under the heading *Source*?

8 A. "FGD system, .56 million gallons a day." That's
9 the same number that was on our schematic.

10 Q. All right. I'm going to jump a little further
11 along in this document to page 52, which was not in the
12 binder, but let me just pull it up. And do you see the top of
13 this page where it says, "Based on standard operating
14 conditions, the FGD scrubber below down-flow is estimated to
15 be 300 GPM, i.e., approximately 0.43 MGD"?

16 A. Yes, I see it.

17 Q. Do you know what this number was based on?

18 A. It would be based on capacity.

19 Q. For the 300 MGD, was that a measured flow?

20 A. No. That would be a calculated flow.

21 Q. Mr. Hixson, did the draft permit that TDEC
22 prepared call for use of best management practices, or BMPs,
23 to control the discharge of metal?

24 A. The original draft that came out did not. The
25 final permit did.

1 Q. And were these BMPs identified in the BMP plan?

2 A. Yes. We wrote a BMP plan and turned it in to the
3 State.

4 Q. And what was your involvement in the preparation
5 of that?

6 A. Drafted it.

7 Q. Did you have responsibilities with regard to
8 implementation?

9 A. The plant had responsibilities for implementation.

10 Q. And what practices were identified in that plan?

11 A. The best management practices were, we put in the
12 rock check dams. We rip-wrapped all of the sluice channel.
13 We rip-wrapped all of the dikes, approximately 7200 linear
14 feet of dikes, both on the outside and inside of the dikes,
15 with rock. We dredged the settling pond, which was No. 3, so
16 that we eliminated any potential for short-circuiting.

17 We rip-wrapped the splitter dike between three and
18 four, between the settling pond and the stilling pond. We
19 installed a weir. We added the capability to add chemical
20 coagulants at three different locations, up here at the rock
21 check dam at No. 1, here at the splitter dike at No. 4, and if
22 any dredging activity was going on in the settling pond, on
23 the dredge itself.

24 We also added three turbidity curtains here in the
25 stilling pond. We rebuilt the weirs for the discharge going

1 out to the river. We also lowered the water elevation in
2 these two ponds from 805 mean sea level to 801.5.

3 Q. So are those practices all part of how to control
4 for suspended solids?

5 A. They were, one, for stability of the dikes and,
6 two, to improve settling capabilities there, yes.

7 Q. And were those practices part of the general
8 maintenance of the ponds, and things that would have been done
9 before this permit was issued?

10 A. Yes.

11 Q. So does the BMP plan include any additional
12 controls designed specifically to treat for dissolved metals?

13 A. Well, for metals and solids, the chemical
14 coagulants. We did not have permission to use chemical
15 coagulants until we went through and did this in 2010.

16 Q. And once TVA completes its conversion to dry
17 handling, will these controls for solids be required?

18 A. They will still be used. You may not have to call
19 upon the chemical coagulant as much, because you've reduced
20 your flow and you've reduced your constituents coming through.

21 Q. Could you just tell us generally about TVA's plans
22 for conversion to dry handling of full combustion waste?

23 A. As I had already stated, the dry fly ash was
24 converted in 1992, with the exception of startup. That was
25 taken care of in 2010. Since 2010 all fly ash has gone to the

1 landfill via truck. The gypsum dewatering and the bottom ash
2 dewatering, that project started in 2012 and is scheduled to
3 be done in late 2014. That will eliminate an additional six
4 million gallons of water that currently come down the sluice
5 channel into these ponds.

6 Q. And those dewatering plans, are those included in
7 TVA's 2011 ash pond closure plan?

8 A. Yes, they are.

9 Q. And what was your involvement in preparation of
10 that plan?

11 A. That was a team effort between URS, Stantec, and
12 TVA to draft that.

13 Q. And did TVA's commitment to close its ash pond to
14 dry handling of coal waste come as a result of the pond
15 failure at the Kingston plant?

16 A. It came as a result of our CEO at that time,
17 Mr. Kilgore, deciding that we would get out of the pond.

18 Q. And in addition to the dewatering that you said
19 had been started, that process, had TVA begun any other
20 implementation of that closure plan?

21 A. Yes -- no. I'm sorry, I gave you two answers.
22 The Kemp pond down here was separate. It has been closed.

23 Q. And I believe you mentioned that the bottom ash
24 waste stream would be dewatered before 2014?

25 A. At the end of 2014.

1 Q. And the same goes for the scrubber wastewater?

2 A. The scrubber wastewater will be -- and dewatered,
3 I don't want to mislead anyone. We're not getting rid of the
4 water. We are taking the gypsum and applying it across a belt
5 filter in which the gypsum will stay on top of the belt
6 filter. We'll vacuum the water out of it. The water will
7 then be discharged again to these treatment systems right
8 here.

9 Q. So just to clarify, after the conversion to dry
10 handling, waste streams will remain?

11 A. The gypsum waste stream will remain. The bottom
12 ash stream, since bottom ash is so inert, that water will be
13 recycled back into the plant.

14 Q. And the remaining wastewater streams will continue
15 to use this pond system?

16 A. The remaining low volume waste treatment, low
17 volume waste sources, your roof drains, your coal yard runoff,
18 the property runoff will all continue to use this sluice
19 channel, this treatment pond, and this treatment pond.

20 q. But does the ash pond closure plan contemplate
21 closure of all these ponds at some point in the future?

22 A. That is correct.

23 Q. And by when would TVA plan to complete that
24 closure?

25 A. It's a stepwise fashion that you have to go

1 through. You first dewater your bottom ash, and you eliminate
2 an additional six million. At the time of the application
3 that she showed, we were in the 18 and 19 million gallons.
4 We're now in around the 12 million gallon range, based upon
5 our discharge monitoring reports that are turned in to the
6 State. We take out the bottom ash. That's an additional six
7 million gallons. That'll take us down to six million.

8 And at that point, we need to see what the new
9 ELGs will be before you can build a treatment system. So we
10 have to build a treatment system before you can get out of the
11 pond.

12 Q. So any wastewater treatment facility will be
13 designed and built only after the final ELG is released?

14 A. That is so that TVA will be on the same playing
15 field as all other utilities, yes.

16 Q. And has TVA committed to closing the ash ponds
17 regardless of the outcome or the timing of the ELG?

18 A. Restate that.

19 Q. For example, if it gets delayed years and years,
20 how would it affect the closure plan for the pond?

21 A. You wouldn't build your wastewater treatment plant
22 until you knew what your effluent guidelines are going to be,
23 what specifications you have to meet.

24 Q. Does the ash pond closure plan identify a 2021
25 time frame for estimated closure of all ponds?

1 A. That is our target, yes. That can be delayed by
2 delay of the regulations. And again -- and let me restate.
3 This is not being closed by a regulation. It's being closed
4 because our former CEO elected to do that.

5 Q. And has TVA estimated that the closure of the pond
6 will cost approximately \$100 million?

7 A. That is correct.

8 Q. And is TVA currently on target to meet that 2021
9 closure date?

10 A. Gypsum dewatering and the bottom ash dewatering
11 will be completed the end of 2014. We are waiting on the
12 ELGs. We would have to see what our wastewater volume at that
13 time is and what the constituents are and what our limitations
14 are for discharge.

15 Q. Aside from the federal regulation, is there
16 anything else that might delay the schedule of closure?

17 A. Not that I'm aware of.

18 Q. In pond No. 3, at the bottom of the exhibit, the
19 eastern portion of that pond, is that referred to as the
20 inactive portion of the ash pond?

21 A. No, ma'am. The inactive portion is this right
22 here.

23 Q. Yes, sorry. That's what I was -- okay. And that
24 has been identified for closure first?

25 A. That would be closure first; that is correct.

1 Q. Does TVA plan to close that by 2014?

2 A. No, ma'am. You would try to close it all at one
3 time, primarily because you're placing on it a cap which is
4 two feet of clay, ten to the minus seven on permeability, and
5 then you're putting twelve inches of soil on there and
6 establishing grass.

7 If you were to go and try to close this corner of
8 it and then come back in and close the whole thing, you might
9 have your drainage, your surface drainage, incorrect. You
10 might have to run equipment near it or by it. So, no, you'll
11 just wait.

12 Q. Let me just pull up real quick the schedule that
13 was included with the ash pond closure plan, which is
14 Exhibit 62, attachment D. I don't think it's in the binders.

15 Okay. Do you see here where it has ash pond
16 closure and inactive fly ash pond? It looks like it's aimed
17 to be closing around 2014?

18 A. Yes, ma'am, and that is modified and kept
19 up-to-date on a quarterly basis with the State through our
20 DMRs. We attach it to the DMR, and it is sent in to the State
21 for them to know if anything has slid on the schedule.

22 Q. So that has been updated?

23 A. That has been updated.

24 Q. Is there anything else in the schedule, to your
25 knowledge, that's been changed?

1 A. The Kemp pond was closed in 2012 instead of 2013.
2 This shows the gypsum dewatering finishing at the end of
3 calendar year 2014, which is what I indicated to you, gypsum
4 and bottom ash. All of these have already been done and were
5 done at the end of 2012.

6 Q. Okay. If you look down for phase 2, fly ash pond
7 ending 2019, is TVA still on target to meet that date?

8 A. That date could be anywhere from 2019 to 2021
9 currently.

10 Q. Okay. Then if we look at phase 3 of the ash
11 sluice pond, has that target date changed?

12 A. Again, that could have slid by a year, yes.

13 Q. And can closure of that ash sluice pond be
14 completed only after the bottom ash and scrubber wastewater
15 dewatering takes place?

16 A. Right. That's correct.

17 Q. And if we look at phase 4, the sluice channel and
18 stilling basin, has that date changed?

19 A. It could have slid by a year. These are internal
20 dates to TVA.

21 Q. Right.

22 A. They are not regulatory-driven.

23 Q. Does TVA plan to construct new facilities to treat
24 the remaining wastewater streams?

25 A. That will, again, depend on the ELGs. But, yes,

1 we're replacing the ponds, as you have pointed out. They may
2 be replaced with a new pond or they may be replaced with some
3 type of treatment applicable.

4 Q. Do you know if TVA anticipates building more than
5 one facility or if one facility will address all the waste
6 streams?

7 A. No, ma'am. I do not know that at this time.

8 Q. And, again, I think you answered this already, but
9 will TVA continue to discharge wastewater streams remaining
10 after dry handling through the stilling pond and out
11 Outfall 001?

12 A. Yes, ma'am. Your stormwater continues to be
13 routed that way, along with your building sumps, your roof
14 drain. Those waste streams will still go through that way.

15 Q. And any of the scrubber wastewater until the new
16 facility is built?

17 A. Until the new facility is built.

18 Q. You mentioned TVA considering new facilities?

19 A. I said TVA is looking at new facilities, including
20 ponds.

21 Q. Has TVA considered chemical treatment for the
22 scrubber wastewater?

23 A. Again, since I've moved into a waste management
24 activity and not a water, I don't have the details on that.

25 Q. So would you happen to know whether TVA has done

1 any cost analysis for that sort of treatment?

2 A. No, ma'am. I do not have that information.

3 Q. And in addition to the HDR report, which you were
4 aware of, do you know whether TVA has produced or contracted
5 with another entity to produce any more reports regarding the
6 wastewater --

7 A. The HDR contract is still an active contract.

8 Q. Have any seeps been discovered at the Bull Run
9 pond?

10 A. Define seeps.

11 Q. Why don't you define seeps?

12 A. Okay. A seep can be a wet spot on the side of a
13 dike, as defined by TVA.

14 Q. Could it also be some sort of a breach in the
15 dike?

16 A. It could be an indicator of a breach in the dike,
17 but it depends upon the volume of water one finds. If it's a
18 wet spot, typically that's not a major concern. One takes
19 care of that as part of your maintenance that you do.

20 Q. So in the range of wet spots to a seep, that would
21 be more serious. Has anything like that been discovered at
22 the dikes in the Bull Run pond system?

23 A. A few wet spots have been discovered; anything
24 more serious than that, no.

25 Q. And has TVA taken any action to address those?

1 A. Yes. The TDEC permit requires us to do a daily
2 inspection of the dikes, a weekly inspection, and then we
3 follow that up with a monthly, in which we take one of our
4 management members of the Bull Run staff out with the
5 environmental person to look at the dikes. And then on a
6 quarterly basis, when we were doing all of this work, our
7 project team would walk down the dikes.

8 And then on an annual basis, we bring in an
9 outside professional engineer to walk the dikes to determine
10 if there are any issues with the dikes that need to be
11 replaced or repaired that we have not seen.

12 Q. So have there been any seeps that were serious
13 enough to require repairs?

14 A. Not at Bull Run.

15 Q. Mr. Hixson, do you recall having your deposition
16 taken in this case?

17 A. Yes, I do.

18 Q. And do you remember being under oath at the time
19 you gave your deposition?

20 A. Yes.

21 Q. I'm going to hand you a copy of your deposition.

22 A. All right.

23 MS. LEE: Your Honor, may I approach?

24 ADMINISTRATIVE JUDGE: Yes, please.

25 MS. LEE: I'll give you a page number in a

1 minute.

2 THE WITNESS: All right.

3 Q. (By Ms. Lee) Have you seen this before?

4 A. Yes, ma'am. I have reviewed this deposition.

5 Q. Okay. If you could, please turn to page 70 and
6 take a look at line No. 9, starting at line No. 9.

7 A. Yes, ma'am. It says that "the report says a flow
8 of red water seep was observed on the west side."

9 Q. Okay. And then if we jump down to line 14, and
10 this is your answer to question -- explaining what a seep is.
11 I'm sorry, let's just jump to page 71 at the top.

12 A. All right.

13 Q. And do you see where it says -- this was your
14 testimony. But it did mean you observed water coming from
15 that portion of the dike and that a repair would be necessary?

16 A. Yes, ma'am, but that didn't mean it was serious.

17 Q. I asked you if a repair was done, sorry.

18 A. If we find a rut in the dike, that may have been
19 caused by erosion. If we find -- or someone got off of the
20 road and got stuck and then tried to drive their truck back
21 onto the road and left a tire mark in the dike, if we had a
22 bush or a tree start to grow, and we tried to take out the
23 roots that would have been associated with it, those are all
24 maintenance repairs.

25 If we find a wet spot, we do put dirt back on top

1 of it. If it is a persistent one, then we would dig to
2 determine what the cause of that wet spot is. That would be
3 more serious. Have we had one of those at Bull Run? No,
4 ma'am.

5 Q. Thank you. For any of the seeps or the wet spots
6 on the Bull Run dike, has TVA made any attempt to quantify
7 discharge of water through the dike?

8 A. A wet spot is not discharging water to the -- in
9 this case, the Clinch River. It's like you're walking out in
10 your yard, and you have a septic tank, and there is a wet spot
11 there. That's not discharging to a stream or anything of that
12 sort, but it may be an indicator that there is an issue that
13 you need to address.

14 Q. So just to be clear, TVA hasn't made any attempts
15 to quantify, sort of, water?

16 A. No, ma'am. It would be difficult to measure,
17 because this is not flowing.

18 MS. LEE: All right. Thank you,
19 Mr. Hixson. Petitioners have no further questions for you at
20 this time.

21 MR. CALLAWAY: TVA has.

22 ADMINISTRATIVE JUDGE: Okay.

23 MR. CALLAWAY: Ed Callaway with Waller for
24 the intervenor, Tennessee Valley Authority. I just have a
25 couple of questions for Mr. Hixson.

CROSS-EXAMINATION

1

2 BY MR. CALLAWAY:

3 Q. Mr. Hixson, you were asked a number of questions
4 about the characterization of the wastewater flowing into the
5 gypsum disposal area. Do you recall that?

6 A. Yes.

7 Q. You were not involved in the preparation of that
8 report that she was referring to; is that correct?

9 A. No, I was not.

10 Q. Is it your understanding that the Water Quality
11 Act, based on your experience and your position working with
12 permits, regulates discharges to waters of the state?

13 A. Yes, it does.

14 Q. Do you sample at Bull Run -- does TVA sample at
15 Bull Run all points of discharge to waters of the state?

16 A. Yes, we do, discharge 001, 002, yes.

17 Q. Does the Act regulate wastewater quality upstream
18 of that before the wastewater is treated?

19 A. Internal to the plant, no.

20 Q. And is that what you believe the influent to the
21 gypsum sulfur area is?

22 A. That's an internal monitoring point, if one were
23 to monitor it, yes.

24 Q. Okay, thank you. With respect to the pond closure
25 discussion, when did TVA decide to close the ash pond at Bull

1 Run? When was that decision taken?

2 A. That decision was taken after the Kingston
3 incident.

4 Q. And what was the reason, as you understand it, for
5 that decision?

6 A. At that time our CEO, Mr. Tom Kilgore, made that
7 decision, that that was a safety issue to the public and that
8 he wanted to eliminate that. And I'm paraphrasing, but I
9 believe that is what he told Congress.

10 Q. Was it related at all to the effectiveness of the
11 ponds for wastewater treatment?

12 A. No. It didn't address anything associated with
13 the ponds as a treatment system.

14 Q. And the ash pond closure plan that you were
15 involved in the preparation of, does it address the closure of
16 all ponds existing in here, or does it simply address the
17 ponds that exist in --

18 A. The existing ponds that were shown in the aerial
19 photo.

20 Q. If the federal effluent limitation guideline, the
21 revised version that there's been a lot of discussion on, if
22 that came out and allowed it, would TVA consider using a new
23 pond to treat remaining wastewater?

24 A. Yes.

25 Q. So does the pond closure plan and the future

1 closure mean that ponds are not an acceptable treatment
2 technology now or may not be in the future?

3 A. No, not at all. It simply is addressing the
4 existing ponds from a safety standpoint.

5 Q. So that's a completely separate evaluation?

6 A. Yes.

7 Q. And is there any regulatory reason that is driving
8 TVA's decision for a timetable to close the ponds?

9 A. No. Again, it was a decision made by our former
10 CEO to avoid a potential Kingston incident.

11 MR. CALLAWAY: That's all I have. Thank
12 you.

13 ADMINISTRATIVE JUDGE: Anything from the
14 Department?

15 MR. PARKER: No, Your Honor.

16 ADMINISTRATIVE JUDGE: Any questions from
17 members of the board?

18 Mr. HEAD: Mr. Hixson, you talked a little
19 bit earlier in your testimony about there were metals in the
20 sulfurization waste. I was curious about what metals were
21 present.

22 ADMINISTRATIVE JUDGE: Can we get you to
23 repeat your question for the record, please?

24 MR. HEAD: Sure. Earlier in your
25 testimony you talked about there were metals in the

1 sulfurization waste, and I was curious about what metals were
2 present.

3 THE WITNESS: You would have copper, zinc,
4 iron. Because it is coming from a coal-fired facility, you
5 could see selenium, arsenic. But they would all be at trace
6 levels, and that is what our discharge to the Clinch River has
7 shown.

8 MR. HEAD: You also mentioned that you had
9 been requested to determine levels of mercury in the Clinch
10 River upgradient of outfall No. 1. What type of levels of
11 mercury did you find there?

12 THE WITNESS: Mr. Alexander asked that
13 we -- he's the permit writer, Mr. Alexander, asked that we
14 provide, if we could, samples from the Clinch River. We sent
15 a sampling crew out using a low level mercury analysis, and
16 we're talking in the nanograms per liter.

17 MR. HEAD: Talking about nanograms per
18 liter?

19 THE WITNESS: Yes, sir.

20 MR. HEAD: Parts per trillion?

21 THE WITNESS: Parts per trillion, upstream
22 of the facility, parallel to our intake, parallel to our
23 outfall.

24 MR. HEAD: And you mentioned earlier that
25 you did a chemical analysis for the effluent leading into -- I

1 guess discharge into the Clinch at discharge 001. Do you
2 happen to recall what kind of levels they had in the effluent?

3 THE WITNESS: Again, in the parts per
4 trillion range, yes. And those numbers are turned in on the
5 DMR monthly to the State of Tennessee, to TDEC, and are also
6 charted on an Excel spreadsheet that we share with the State.

7 MR. HEAD: And do you happen to know what
8 the MCL is for mercury in drinking water?

9 THE WITNESS: Not right off the top of my
10 head, no, sir. But it is on that Excel spreadsheet chart that
11 I just spoke of.

12 MR. HEAD: And then I wanted to follow up
13 with two or three questions on the reason for the change in
14 operation of the facility, just to make sure that I
15 understood.

16 In your current operation, are you having
17 any trouble meeting the requirements of the NPDES permit in
18 terms of discharge that's going into the Clinch River?

19 THE WITNESS: No, sir, not at all.

20 MR. HEAD: And you are conducting regular
21 monitoring for metals in that?

22 THE WITNESS: Yes, sir. It's a report
23 only. It's not against a numerical limit. But it's a report
24 only, and those are turned in on the DMR on a monthly basis.

25 MR. HEAD: Now, what I thought I heard you

1 say when he asked you this question, any changes that TVA is
2 making in the water treatment system that is currently present
3 is due to obtaining fundamental changes in the operation,
4 moving from a wet ash operation to a dry ash operation?

5 THE WITNESS: That is correct.

6 MR. HEAD: And part of the driving factor
7 for that, is that due to structural stability concerns about
8 the facility or ...

9 THE WITNESS: It is -- if you look at
10 Mr. Kilgore's commitment, it is a two-part commitment. One,
11 you would upgrade the current dikes so you would not have that
12 Kingston event happen again. And, two, you would go dry. So
13 we took care of the first one immediately.

14 The second one we are in the process of
15 building the gypsum dewatering and the bottom ash dewatering
16 so that we can eliminate water from the bottom ash, the gypsum
17 water. Currently we're planning to discharge the .56 million
18 gallons a day into the treatment system.

19 MR. HEAD: And in your opinion, is
20 management of coal combustion byproducts more effective than
21 managing dry waste and wet waste?

22 THE WITNESS: Yes.

23 MR. HEAD: Thank you.

24 ADMINISTRATIVE JUDGE: More questions?

25 MR. McCLURKAN: I have just one. I think

1 you mentioned that the Bull Run plant, so far in 2013, has
2 operated 61 days?

3 THE WITNESS: That is correct.

4 MR. McCLURKAN: What does that mean?

5 THE WITNESS: Well, TVA outlines for each
6 of its plants its capacity that it's going to use, its
7 capability. My term is incorrect, and I apologize for that.
8 The plant in TVA, you're either online, and that's for our
9 base load facility. That's your Sequoia, your Watts Bar
10 Nuclear, your Browns Ferry Nuclear, and your large fossil
11 plant like Cumberland.

12 Those are all what we call baseline, and
13 baseline run every day the maximum that you can run out at
14 that plant. It may not be the boilerplate tag that is for
15 that plant, but it's within a hundred megawatts below that.
16 Those run all the time.

17 Then you supplement that with your hydros
18 and your gas. And then you have other smaller coal plants
19 like Colbert that can turn on and turn off a lot easier than
20 Bull Run. Bull Run is a single-unit plant, and it's rated
21 boilerplate at 950. It does a nominal 750 to 850 megawatts in
22 generation.

23 It's so large you can't -- it's like
24 taking a semi or an aircraft carrier and trying to turn an
25 aircraft carrier around on a dime. You can't do that. You

1 can't stop and start it. When you run Bull Run, you need to
2 have it run for three -- usually about three weeks minimum.

3 MR. McCLURKAN: So when it's offline --

4 THE WITNESS: It's called NID, not in
5 demand, and Bull Run is currently classified NID, not in
6 demand. So it is not the first plant you're going to turn on.
7 If we had a cold snap come through or a heat wave come
8 through, other plants would go online in front of Bull Run.
9 Right now it is scheduled to run no greater than four months
10 out of the year.

11 MR. McCLURKAN: And when it is offline,
12 not running, is there discharge from this scrubber unit?

13 THE WITNESS: There is no discharge from
14 the FGD scrubber unit. There's no discharge of bottom ash.
15 The only thing that you will have at that time will be
16 stormwater runoff from the coal yard pond, your building
17 sumps, because you do still have activity within the building
18 itself. But these are all classified as low volume waste
19 treatment, very small quantities of water going out.

20 That's why if you looked on our DMRs,
21 originally it was listed as 18 to 19 million gallons. We took
22 out six million. That dropped us in the 12 to 13. Our DMRs
23 for the last three years, 12 million is the high that we've
24 hit. That includes our stormwater. And the low that we've
25 had has been in about the high eight or low nine million

1 gallon range.

2 MR. McCLURKAN: Thank you.

3 THE CHAIRMAN: Mr. Hixson, we saw three
4 charts in the petitioners' opening argument that showed high
5 spikes for arsenic, mercury, and selenium. Do you know
6 whether those were measured at the point of discharge into the
7 Clinch, or were those measured pretreatment?

8 THE WITNESS: May I see your chart again?

9 (Pause in proceedings.)

10 MS. MATHENY: May I approach?

11 ADMINISTRATIVE JUDGE: It was on his
12 monitor there for a second.

13 MS. MATHENY: Oh, it was?

14 THE WITNESS: Yeah. It wasn't on the
15 screen, but it flickered. I see it on my screen. Thank you.
16 The value that's shown here, the .34, that is going into the
17 gypsum disposal area, which was the pond No. --

18 THE CHAIRMAN: Pretreat?

19 THE WITNESS: That's pretreat, yes.

20 THE CHAIRMAN: Not what you're --

21 THE WITNESS: That is not what's being
22 discharged; that is correct.

23 THE CHAIRMAN: Thank you.

24 ADMINISTRATIVE JUDGE: Questions from the
25 parties? Ms. Lee?

1 MS. LEE: Brief redirect, Your Honor.

2

3

REDIRECT EXAMINATION

4 **BY MS. LEE:**

5 Q. Mr. Hixson, you were asked a couple of questions
6 regarding requirements of the law and the monitoring
7 discharges into waters of Tennessee. Were your answers to
8 those questions your opinions and your understanding of what
9 the law requires?

10 A. That is correct.

11 Q. And can you confirm that when the scrubber
12 wastewater is not flowing because the plant is not running,
13 are other waste streams flowing into the pond system?

14 A. As I answered for the Board, the low volume waste
15 sumps, some equipment drainage and cooling are still
16 occurring; that is correct.

17 Q. Thank you. And you mentioned that TVA would
18 consider, depending on what the ELG required, to build new
19 ponds and replace the ponds that TVA is now closing and is
20 spending \$100 million to close; is that correct?

21 A. That is correct.

22 Q. Was that consideration disclosed in the 10(k)
23 filing for the company?

24 A. It was disclosed as part of the treatment options
25 that we would be looking at.

1 MS. LEE: Thank you. Nothing further.

2 ADMINISTRATIVE JUDGE: More from TVA?

3 MR. CALLAWAY: No, Your Honor.

4 ADMINISTRATIVE JUDGE: Anything more from
5 the Board?

6 THE CHAIRMAN: No.

7 ADMINISTRATIVE JUDGE: You're excused.

8 Thank you so much.

9 THE WITNESS: Thank you.

10 ADMINISTRATIVE JUDGE: Petitioners' next
11 witness? Is everybody good? Are you good?

12 COURT REPORTER: Yes.

13 MS. MATHENY: Petitioners call Robert
14 Alexander.

15 ADMINISTRATIVE JUDGE: If you would, raise
16 your right hand.

17

18 **ROBERT ALEXANDER,**

19 having been first duly sworn, was examined and testified as
20 follows:

21 **DIRECT EXAMINATION**

22 **BY MS. MATHENY:**

23 Q. Good afternoon, Mr. Alexander.

24 A. Good afternoon.

25 Q. As you know, I'm Stephanie Matheny. We've had

1 occasion to talk once or twice. Can you please state your
2 name for the record?

3 A. Bob Alexander.

4 Q. And I want to ask a logistical question. Can you
5 see the exhibits that are being projected right now on your
6 screen?

7 A. I can see a copy of the permit on the screen.

8 Q. Okay. I believe all of the exhibits I'm going to
9 refer to are in your book, and it's primarily the permit which
10 is Exhibit 1. Mr. Alexander, what is your position at TDEC?

11 A. I'm a NPDES permit writer.

12 Q. And did you write the NPDES permit for TVA's Bull
13 Run Fossil Plant?

14 A. Yes, I did.

15 Q. Okay. Can you please turn to the cover sheet for
16 Exhibit 1, which is the permit, I believe. That's the first
17 sheet.

18 THE CHAIRMAN: That does not appear to be
19 what --

20 MR. PARKER: There's three --

21 THE CHAIRMAN: Which book?

22 MR. PARKER: The big book, and there are
23 demonstratives and then there are the actual exhibits. I
24 guess that's the last set.

25 Q. (By Ms. Matheny) All right. Mr. Alexander, do

1 you see the first page of Exhibit 1?

2 A. Yes.

3 Q. And is this a copy of the permit that's at issue
4 in this appeal?

5 A. Yes.

6 THE CHAIRMAN: Your Honor, one of our
7 board members would like to be able to see this on the screen.

8 ADMINISTRATIVE JUDGE: Is there any way we
9 can fix our technology?

10 MS. MATHENY: May can we take a short
11 break?

12 ADMINISTRATIVE JUDGE: Let's take five
13 minutes, and we can do what needs to be done.

14 (Recess taken.)

15 (BY THE ADMINISTRATIVE JUDGE) All right,
16 we're back on the record. Technical difficulties fixed. You
17 may proceed, Ms. Matheny.

18 MS. MATHENY: Thank you.

19 Q. (By Ms. Matheny) We're on the cover sheet of the
20 permit, which is marked TVA_BRF_0000688. Is that correct,
21 Mr. Alexander?

22 A. Yes.

23 Q. And, Mr. Alexander, what was the issuance date of
24 this permit?

25 A. The issuance date was September 30th, 2010.

1 Q. And when is the permit set to expire?

2 A. November 1st, 2013.

3 Q. Mr. Alexander, TDEC received an application for
4 renewal from TVA?

5 A. Yes, we have.

6 Q. Did it receive the application in a timely manner?

7 A. Yes, we did.

8 Q. And, therefore, can TDEC extend the permit,
9 administratively, beyond November 1st?

10 A. By deeming the permit application complete, the
11 facility's permit is in administrative leave standing.

12 Q. Thank you, Mr. Alexander. Is TDEC waiting for the
13 results of this hearing before it issues a draft renewal
14 permit?

15 A. Not that I'm aware of.

16 Q. Is TDEC waiting for anything else before it issues
17 a draft renewal permit?

18 A. Not that I'm aware.

19 Q. Let's turn to page 1 of 20 -- I'm sorry, page 1 of
20 28, and the top of this is marked part 1, "Effluent
21 Limitations and Monitoring Requirements". Is that correct,
22 Mr. Alexander?

23 A. Correct.

24 Q. Now, this page shows that the permit covers three
25 outfalls to the Clinch River; one, two, and four; is that

1 correct?

2 A. That's correct.

3 Q. And the permit allowed TVA to discharge various
4 coal combustion wastewaters and coal power runoff and other
5 miscellaneous runoff wastewaters to the Clinch River via
6 Outfall 001?

7 A. Correct, yes.

8 Q. And is one of these wastewater streams the
9 scrubber wastewater stream that we have been talking about?

10 A. Yes, it is.

11 Q. And does the FGD wastewater stream carry
12 pollutants removed from the scrubber?

13 A. Outfall 001, which discharges to the Clinch River,
14 does carry wastewater from the FGD scrubber, yes.

15 Q. And, more specifically, does the FGD wastewater
16 stream carry pollutants that are removed from air emissions by
17 the scrubber?

18 A. Yes.

19 Q. So, Mr. Alexander, this permit involves moving
20 pollutants from air emissions to surface water discharges; is
21 that correct?

22 A. Yes.

23 Q. And as we've heard Mr. Hixson testify, TVA is in
24 the process of converting to dry handling of coal ash; is that
25 correct?

1 A. Yes.

2 Q. And will that affect which of the wastewater
3 streams at Outfall 001 will remain?

4 A. Yes.

5 Q. And, in particular, the scrubber wastewater stream
6 will remain after dry conversion; is that correct?

7 A. Yes.

8 Q. Okay. Let's turn to the next page.
9 Mr. Alexander, does this page list the limits applicable to
10 Outfall 001?

11 A. Yes, and the monitoring requirements associated
12 with it.

13 Q. And, Mr. Alexander, at Outfall 001 there are
14 permit limits for pH, oil and grease, and total suspended
15 solids; is that correct?

16 A. That's correct.

17 Q. And are these limits derived from EPA's 1982
18 Effluent Limitation Guidelines?

19 A. Yes.

20 Q. And are these guidelines based on the performance
21 of settling ponds?

22 A. In part, yes.

23 Q. But there are no treatment technologies available
24 for these coal combustion wastewater streams since 1982; is
25 that correct?

1 A. Correct.

2 Q. And TVA uses settling ponds for its coal
3 combustion wastewaters at Bull Run?

4 A. Yes.

5 Q. And these ponds at Bull Run are not lined?

6 A. I'm told they are not lined.

7 Q. And these unlined ponds at Bull Run have seeps; is
8 that correct?

9 A. I don't recall.

10 Q. Does the permit require TVA to monitor and report
11 the metals listed on this page?

12 A. Of course.

13 Q. But there are no limits on these metals at Outfall
14 001?

15 A. That is true.

16 Q. And the last item on this chart is IC-25. Is that
17 a measure of whole effluent toxicity?

18 A. Yes.

19 Q. And the permit imposes a monitor-only requirement
20 for whole effluent toxicity; is that correct?

21 A. That's true.

22 Q. So there is no whole effluent toxicity limit at
23 Outfall 001?

24 A. That's true.

25 Q. Let's turn to your response to comments, which

1 starts at page NOD-1. Mr. Alexander, is this the first page
2 of the Notice of Determination you wrote for the final permit?

3 A. That's correct.

4 Q. And does this Notice of Determination respond to
5 comments that were submitted regarding the draft permit?

6 A. Yes, it does.

7 Q. Let's turn to page NOD-17. Did you draft this
8 section in the permit that starts on this page that's titled
9 *Best Professional Judgment Analysis*?

10 A. Yes. I drafted it, and it was reviewed by my
11 supervisors and the chief engineer of the division.

12 Q. And your supervisor to whom you're referring, is
13 that Mr. Janjic?

14 A. Mr. Janjic, yes.

15 Q. And the chief engineer to whom you are referring,
16 is that Saya Qualls?

17 A. Ms. Qualls, yes.

18 Q. And did you add this section titled *Best*
19 *Professional Judgment Analysis* because the Tennessee Clean
20 Water Network asked for this in their comments on the draft
21 permit?

22 A. That was one reason, yes.

23 Q. What was the other reason, or was there any other
24 reason?

25 A. Well, we felt it was our duty as the regulatory

1 agency to use this document, this approach, this BPJ analysis
2 as a vehicle for communicating our responses to those comments
3 that were raised during the public comment review process.

4 Q. And, Mr. Alexander, the goal of a BPJ analysis is
5 to determine technology-based permit requirements; is that
6 correct?

7 A. That's one of the goals, yes.

8 Q. And when you prepared the analysis for this
9 permit, you were not trying to develop technology-based permit
10 requirements; is that correct?

11 A. No, it's not correct.

12 Q. Mr. Alexander, do you recall being deposed for
13 this case?

14 A. Yes.

15 Q. Do you recall that your lawyers were present --

16 A. Yes.

17 Q. -- during the deposition?

18 A. Yes.

19 Q. Do you recall that you were under oath?

20 A. Yes.

21 Q. I'm sorry?

22 A. Yes.

23 Q. Okay. You said yes. And have you seen the
24 transcript of that deposition?

25 A. Yes, I have.

1 MS. MATHENY: Your Honor, may I approach?

2 ADMINISTRATIVE JUDGE: Yes.

3 Q. (By Ms. Matheny) Please turn to page 25 of your
4 deposition transcript. And can you please read into the
5 record lines 8 through 16?

6 A. Well, this is the question.

7 "In this permit, why would the division conduct a
8 BPJ analysis?"

9 Answer: "Because it was necessary to clarify. It
10 was necessary to say what the BPJ analysis was in
11 response to comments that were raised during the
12 permit review process." How much further?

13 Q. To line 16, please.

14 A. Question: "Were you trying to develop
15 technology-based permit requirements?"

16 Answer: "No."

17 Q. Thank you, Mr. Alexander. Early on in your BPJ
18 analysis, did you write an email to Ron Jordan of EPA?

19 A. Yes. I think you showed the excerpt from it in
20 your opening remarks.

21 Q. And we're going to bring it up right now. It's
22 Exhibit 95. Mr. Alexander, in this email did you write that
23 you were trying to address the EIT comments in response to
24 BPJ's permit limits, in essence, a discussion as to why
25 Tennessee will not and cannot set numeric metals limits in

1 advance of EPA's revised ELGs?

2 A. Yes, I did.

3 Q. And was this early on in your response to
4 comments?

5 A. Hold on a second. I think I wrote this -- if
6 you'll give me one second, I want to look at the date that we
7 developed the rationale. That was in January, and we wrote
8 the Notice of Determination in August. So this was about
9 midway between that point, yes.

10 Q. Was this written on April 27, 2011?

11 A. That's correct.

12 Q. Let's turn back to the permit, and specifically
13 page NOD-34. Can you please read the first two sentences of
14 your conclusion from this page?

15 A. Yes. "With a permit term of 2010 to 2013, the
16 watershed cycle year, the NPDES permit for TVA Bull Run Fossil
17 Plant should incorporate nonnumeric best management practices
18 to control concentrations of toxic metals as described
19 herein."

20 Q. Can you please read the next sentence, too?

21 A. "Consistent with 40 CFR 122.44, subparagraph
22 (k)(3), the BMP approach is appropriate, because establishment
23 of numeric limits is infeasible pending EPA publication of
24 revised Effluent Limitation Guidelines."

25 Q. So, Mr. Alexander, is it fair to say that your

1 final conclusion was pretty much consistent with what you had
2 told EPA you were trying to do in April of 2010?

3 A. Yes. I think that what I was trying to say in the
4 EPA memo is that we could not establish numeric limits, and
5 that was what we ended up determining in this Notice of
6 Determination.

7 Q. And, Mr. Alexander, you concluded numeric limits
8 were infeasible, in part, due to a lack of data; is that
9 correct?

10 A. That's correct.

11 Q. But TDEC determined that TVA's application was
12 complete; is that correct?

13 A. Yes. The application is complete in terms of the
14 amount and types of information that it was required to submit
15 under the rules. But our determination that establishment of
16 numeric metals limits wasn't feasible was because we lacked
17 numeric data on the performance of treatment technologies that
18 would have been deemed as best available treatment technology.

19 Q. Thank you, Mr. Alexander. Now, in conducting a
20 BPJ analysis to determine that the EPA established specific
21 factors to evaluate --

22 A. Yes.

23 Q. And did its factors include the age of the
24 equipment?

25 A. Yes.

1 Q. Do they include the process employed?

2 A. Yes.

3 Q. Do they include the process changes?

4 A. They do.

5 Q. Do they include non-water-quality environmental
6 impact?

7 A. Yes, they do.

8 Q. Do they include engineering aspects for various
9 types of control technology?

10 A. They do.

11 Q. And do they include the cost of achieving that
12 reduction?

13 A. Yes, they do.

14 Q. Let's walk through your consideration of these
15 factors. Regarding the age of the facility, Mr. Alexander,
16 did you conclude that the age of the Bull Run facility was not
17 a significant factor, because it was infeasible to set permit
18 limits in numeric form?

19 A. No, not for that reason.

20 Q. Mr. Alexander, can you please turn back to your
21 deposition transcript on page 41? Can you please read lines
22 14 through 21?

23 A. Line 14 is the answer. So I'm saying: "Un-huh, I
24 don't think age was a significant factor at all in
25 determining the decision that we reached in the

1 BPJ analysis."

2 Then the question: "Why not?"

3 The answer: "Because the decision that we reached
4 in this BPJ analysis was that there wasn't
5 available information upon which to establish
6 numeric effluent metals limits, that doing that
7 wasn't feasible." It still is.

8 Q. And, Mr. Alexander, I don't have the deposition in
9 front of me, but did you just add "it still is", or was that
10 from the transcript?

11 A. No. But if I could, I would add that it still is.

12 Q. Okay. Thank you, Mr. Alexander. Regarding the
13 process employed, did you conclude that the type of coal used
14 at the facility could fundamentally affect the constituents in
15 the ash?

16 A. What we said in this BPJ analysis was that
17 information that we had to date pointed to that very fact.

18 Q. So is that a yes?

19 A. Yes.

20 Q. But does the permit specify the type of coal that
21 TVA can use at Bull Run?

22 A. No.

23 Q. Mr. Alexander, for process changes let's look at
24 page NOD-33. I'm going to read the final sentence under
25 "process changes". It says, "Based on public statements made

1 by TVA regarding conversion to dry ash, to eliminate ash
2 sluiced water, this process change negates the need for
3 consideration of additional control since no additional
4 technology could be installed sooner than the dry ash
5 conversion system." Did I read that correctly?

6 A. Yes.

7 Q. And, Mr. Alexander, as we discussed earlier, these
8 process changes will not eliminate the scrubber wastewater; is
9 that correct?

10 A. Yes, that is correct.

11 Q. So regardless of the process changes you
12 considered here, the scrubber wastewater will remain and will
13 require treatment?

14 A. That is true.

15 Q. Since we're on this page, let's go ahead and
16 address non-water-quality environmental impacts. Was it your
17 conclusion that you could not identify non-water-quality
18 environmental impacts until EPA issues the revised ELGs?

19 A. The conclusion we reached in this BPJ analysis is
20 that we didn't have information on the non-water-quality
21 environmental impacts that would allow us to determine the
22 best available technology and, thus, the numeric limits that
23 we could impose that technology would be expected to provide.

24 Q. And, Mr. Alexander, can you please read the last
25 sentence under factor 5 starting with the word "given"?

1 A. "Given that this aspect of analysis cannot assist
2 us in selecting optimal treatment technologies for coal ash
3 wastewater, non-environmental impacts cannot be identified or
4 used in a decision-making process in the EPA's publication of
5 revised ELGs expected in 2013."

6 Q. And you no longer expect to provide the ELGs in
7 2013, do you, Mr. Alexander?

8 A. No, I do not.

9 Q. All right. Let's discuss the factor regarding
10 engineering aspects of the application of various types of
11 control technology. Mr. Alexander, does your discussion of
12 this factor address the performance of settling ponds?

13 A. Yes. The first paragraph mentions that that's the
14 predominant control technology employed in the U.S.

15 Q. And, Mr. Alexander, your discussion of this factor
16 and the Notice of Determination did not go into the
17 performance of other treatment technologies, because EPA's
18 2009 study report did not select a technology of that; is that
19 correct?

20 A. It is correct that the 2009 report did not select
21 a technology as a BAT.

22 Q. And, Mr. Alexander, is that the reason your
23 discussion of this factor as a determination did not go into
24 the performance of other treatment technologies?

25 A. That's one of the primary reasons, yes. The

1 purpose of this factor is to evaluate "is there an engineering
2 approach to treatment of this wastewater that works today; is
3 there an available solution."

4 And what we were attempting to do in this section
5 of the Notice of Determination is to look at all the various
6 information that EPA had presented and TVA had given us to see
7 could we pick a treatment technology that was the best that
8 there was, and what we concluded from looking at all of this
9 is that there's no way to make that decision.

10 Q. Okay. And, Mr. Alexander, I really want to be
11 clear on this one point. Your discussion of the engineering
12 factor in the Notice of Determination did not go into the
13 performance of other treatment technologies; is that correct?

14 A. Well, it discusses the 2009 report, which did
15 address settling ponds, physical/chemical, and biological
16 treatment. So, by reference, it has knowledge that there's
17 information on those other technologies that exist.

18 But, again, none of that information says that
19 "here is the technology; that is the best in the U.S.," and
20 then you would know what numbers that technology provides so
21 that you could set those as numeric metals limits.

22 Q. So, Mr. Alexander, in your cite that this was a
23 case-by-case best professional judgment analysis, were you
24 relying on EPA to make a conclusion before you could make a
25 conclusion?

1 A. We presented the best available information that
2 we had at the time, and that included EPA information. It
3 included other articles, technical articles, and things that
4 we could find on the web, et cetera.

5 Q. But in the section titled *Best Professional*
6 *Judgment Analysis*, Mr. Alexander, did you evaluate the
7 comparative effectiveness and costs of various treatment
8 options?

9 A. We primarily referenced the EPA 2009 report, which
10 discussed in detail the performance of these technologies at a
11 small set of FGD wastewaters that EPA had information on. In
12 relying on the 2009 EPA study, we found that that study hardly
13 at all addressed the cost of these technologies.

14 And so even though we were aware that there were
15 engineering solutions to treating this wastewater, nothing
16 that we had to rely on could prove to us what the best
17 technology was and what the numeric limits of that technology
18 ought to be.

19 Q. Okay. And, Mr. Alexander, are you familiar with a
20 draft permit EPA prepared for Merrimack Station in New
21 Hampshire?

22 A. Yes, ma'am, I am.

23 Q. And for the Merrimack permit, did EPA conduct a
24 BPJ analysis to propose case-by-case limits on scrubber
25 wastewater?

1 A. Yes, ma'am, they did. It was a very detailed
2 examination of the recycle scrubbers, the scrubber that that
3 facility had, and ended up comparing the likely performance of
4 a scrubber that was still under construction and beginning
5 operation to scrubbers that Duke Power had in North Carolina.

6 Q. And, Mr. Alexander, I just put up Exhibit 90,
7 which is attachment E from the Merrimack Station analysis.
8 Mr. Alexander, have you reviewed this document before?

9 A. Yes, ma'am.

10 Q. Let's turn to page 14 of 52.

11 A. Do I have that here? Are we going --

12 Q. Is it on your screen, Mr. Alexander?

13 A. Yes. Go ahead.

14 Q. I actually have page 16 of the PDF document.

15 A. Yes. I see it.

16 Q. And it starts with section 3.0, "Technological
17 Alternatives Evaluated"; is that correct?

18 A. That's correct.

19 Q. Does part 3 list the technology EPA analyzed in
20 its BPJ analysis for Merrimack Station?

21 A. Yes.

22 Q. And does that list include discharge to a POTW?

23 A. Yes.

24 Q. Does that include evaporation ponds?

25 A. Yes, and a flue gas injection, fixation, deep well

1 injection, and all those are shown on the screen here.

2 Q. Does that include FGD WWTS effluent reuse/recycle?

3 A. It does, indeed.

4 Q. Does that include settling ponds?

5 A. Yes, ma'am, and treatment by the existing WWTS,
6 vapor compression evaporation, physical/chemical treatment,
7 and physical/chemical with added biological stage.

8 Q. So I count, roughly, about 11 alternative
9 technologies that EPA considered. Does that appear to be
10 correct, Mr. Alexander?

11 A. That appears to be correct.

12 Q. And did EPA choose physical/chemical treatment?

13 A. Yes, I believe they did, with biological treatment
14 for this recycle scrubber.

15 Q. Okay. Let's turn back to your analysis for Bull
16 Run. Mr. Alexander, did you consider effluent data as part of
17 your evaluation of this engineering aspect factor?

18 A. Yes, via use of the effluent data that was
19 presented in EPA's 2009 report, and from the ash pond data
20 that TVA presented in their permit applications for 1998,
21 2003, and 2007.

22 Q. And when you wrote this permit, did you conclude
23 that you did not have enough effluent data from TVA regarding
24 toxic metals?

25 A. I'm not sure -- enough data to do what?

1 Q. Let's turn to page NOD-34. Mr. Alexander, under
2 your conclusion, part A, can you read the paragraph labeled 1,
3 "Limited Data", please?

4 A. Yes. "Limited data - Effluent data for toxic
5 metals consists of only three measurements by TVA over the
6 previous 14 years; most effluent metals concentrations are
7 less than detection." These are the effluent metals from the
8 ash ponds.

9 Q. And Mr. Alexander, it was possible to have
10 analyzed the untreated scrubber wastewater at Bull Run; is
11 that correct?

12 A. I'm not sure what you mean by "it was possible".

13 Q. Was it feasible to have analyzed scrubber
14 wastewater at Bull Run?

15 A. In what context are you saying, could anyone have
16 done it?

17 Q. Yes. Could it have been done?

18 A. Oh, yes, ma'am.

19 Q. And, Mr. Alexander, you did not consider asking
20 TVA to provide data regarding untreated FGD wastewater at Bull
21 Run; is that correct?

22 A. We did not ask for that, but that's only half the
23 picture in defining what best available technology is, because
24 you have to have both the influent and the effluent data of
25 all the candidate types of wastewater treatment so that you'll

1 know which one is the best.

2 Q. So, Mr. Alexander, it's correct that you did not
3 consider asking TVA to provide data regarding untreated
4 scrubber wastewater at Bull Run?

5 A. Yes.

6 Q. And, Mr. Alexander, the reason you did not ask TVA
7 for this data is that you concluded it wasn't feasible to set
8 numeric limits; is that correct?

9 A. I would not say that was correct. That might have
10 been one of the reasons, but I'm sure that's not the only
11 reason.

12 Q. Was it one of the reasons?

13 A. Yes, it was one of the reasons.

14 Q. And you did not evaluate alternative treatment
15 technologies for scrubber wastewater, because you believe
16 there wasn't existing data on which to base that analysis; is
17 that correct?

18 A. We referenced what EPA had already published in
19 its 2009 study about the available treatment technologies and
20 relied on that.

21 Q. Mr. Alexander, was that a yes or a no?

22 A. It's not a question you can answer by yes or no.

23 Q. Mr. Alexander, can you please turn to page 63 of
24 your deposition transcript? Can you please read lines 20 to
25 24?

1 A. Line 20:

2 Question: "Why didn't you evaluate other
3 treatment technology for the FGD wastewater
4 strength?"

5 Answer: "There wasn't existing information on
6 which to base any of that analysis."

7 Q. Thank you, Mr. Alexander. And you would want to
8 have the best data that exists in the U.S. to set limits; is
9 that correct?

10 A. Of course.

11 Q. And you believe that this is especially true for
12 TVA, because it is a governmental entity that means so much to
13 the environment and the economy of our region?

14 A. That sounds like a quote. Yes.

15 Q. So you would want all of the treatment data EPA is
16 collecting through its national rulemaking to determine
17 BAT-based effluent limits for Bull Run?

18 A. I would love to have that, and especially as these
19 rules are finalized. But the way it looks right now, EPA has
20 placed all of that data behind the confidential business
21 information door, and permit writers may never have access to
22 that if the rules are finalized the way they are now.

23 Q. So your answer is yes, you would want all of that
24 data?

25 A. Yes, I would want all of that data.

1 Q. Let's turn to your consideration of the factor
2 regarding cost of achieving effluent reduction.

3 Mr. Alexander, your analysis of this factor did not go beyond
4 what EPA had published in its 2009 report; is that correct?

5 A. Well, in the NOD we described what information had
6 been published about costs. I'm referring back earlier in the
7 NOD. That -- give me one second here. I can refer you back
8 to that.

9 In the process of EPA's updating the effluent
10 guidelines, they indicated that the 2009 study lacked enough
11 cost data to support the economic and financial impact
12 analysis that would be required to set BAT.

13 So that's the most important wording that we have
14 about cost in the BPJ analysis is that EPA, at the time that
15 we wrote this, didn't even have enough cost information to
16 decide what the treatment technology is that would be
17 determined to be the best available technology.

18 Q. And, Mr. Alexander, I'm afraid I might have lost
19 your answer there. Is it correct that your analysis of the
20 cost of achieving effluent reduction did not go beyond what
21 EPA had published in its 2009 report?

22 A. Correct.

23 Q. And, Mr. Alexander, when you wrote the permit, did
24 you conclude the data on costs of achieving effluent reduction
25 were not available from existing data collection sources,

1 including the 2009 study?

2 A. We concluded that there was not cost data adequate
3 for us to select a candidate treatment technology as best
4 available technology.

5 Q. And among the data sources that you considered in
6 reaching that conclusion was the EPA 2009 study; is that
7 correct?

8 A. That's correct. As I mentioned, that 2009 study
9 has very little cost information in it.

10 Q. Mr. Alexander, in a case-by-case EPA analysis, you
11 would want all of the economic data that EPA is collecting to
12 develop national Effluent Limitation Guidelines?

13 A. If that data existed, yes.

14 Q. But would you want that data in order to be able
15 to conduct a BPJ analysis?

16 A. I'm not sure how to answer that, because as we sit
17 here today, there is this roomful of cost data that exists at
18 EPA. And I'll say again, if EPA rules are published today the
19 way they are, that cost information is hidden behind the
20 confidential business information door, and permit writers
21 like me may never have access to that in any state. So I
22 don't know how I can answer your question, I'm sorry.

23 Q. Mr. Alexander, do you think that you would need
24 all of that data in order to do a case-by-case BPJ analysis?

25 A. I think our responsibility in the public interest,

1 to serve the public interest, says that we must have -- that
2 the permit writer must have enough cost information on the
3 various treatment options to be sure that we are doing the
4 best job we can in picking a candidate treatment technology
5 and labeling that as the best available treatment upon which
6 the people of our state are going to spend money on to meet a
7 set of effluent limits.

8 Q. Now, Mr. Alexander, EPA did not publish the draft
9 ELG in the Federal Register until June of 2013; is that
10 correct?

11 A. That is correct.

12 Q. Yet other states have managed to develop BPJ-based
13 BAT limits in NPDES permits for power plants; is that correct?

14 A. I have only seen the Merrimack permit and maybe
15 one from Indiana that I have not fully evaluated yet. But I
16 think, for the most part, those are not the same type of
17 process equipment that TVA operates. They are recycle
18 scrubbers as opposed to once-through scrubbers, for the most
19 part.

20 Q. And as we discussed earlier, EPA's BPJ BAT limits
21 for the Merrimack power plant?

22 A. Yes, ma'am.

23 Q. Let's go back to that exhibit, Exhibit 9-D, and
24 I'd like you to turn to the bottom of page 28 of 52.

25 A. Yes. I see it on the screen.

1 Q. Mr. Alexander, what is the title of part 4 here?

2 A. Cost of achieving effluent reductions.

3 Q. Can you please read the first sentence under
4 part 4?

5 A. "PSNH" -- I'm sure that's the name of the utility
6 there -- "chose to install and has largely completed
7 installation of the physical/chemical treatment system at
8 Merrimack Station in New Hampshire."

9 Q. Please read the next sentence.

10 A. "This demonstrates that the cost of the system was
11 not prohibited."

12 Q. Please turn to the next page, which is page 29 of
13 52. And I'm starting in the middle of this paragraph 8 lines
14 down after footnote 16. Can you see that where it says
15 "thus"?

16 A. Yes.

17 Q. "Thus, EPA estimates that the total FGD WWGS,
18 including biological treatment, would be approximately
19 \$1,654,000, based on approximately \$9,823,000 and capital
20 costs of approximately \$727,000 in yearly operating and
21 maintenance costs. Costs on this order of magnitude can
22 reasonably be borne by PSNH. PSNH has been a profitable
23 company and should be able to afford to install biological
24 treatment if it is determined to be part of the Merrimack
25 Station." Did I read that correctly?

1 A. Yes, ma'am.

2 Q. Mr. Alexander, when you prepared the Notice of
3 Determination, had you reviewed the 1982 Effluent Limitation
4 Guidelines?

5 A. Of course.

6 Q. And was it your understanding that EPA had
7 included scrubber wastewater as a low volume waste in this
8 ELG?

9 A. That's correct.

10 Q. Let's go back to the permit on page NOD-25.
11 Mr. Alexander, can you please read the last paragraph on this
12 page?

13 A. The one beginning "federal"?

14 Q. Yes.

15 A. "Federal ELGs are both existing and applicable to
16 waste streams in question. Nevertheless, TDEC must follow the
17 procedure defined under 40 CFR 125.3 to impose
18 technology-based treatment requirements for discharges on a
19 case-by-case basis, using BPJ."

20 Q. But your conclusion at the time was that federal
21 ELGs are both existing and applicable; is that correct?

22 A. That is correct.

23 Q. Please turn to page NOD-26 and the first sentence
24 of the second paragraph under item 2. It says, "In developing
25 the 1982 ELG, EPA considered but did not establish numeric

1 ELGs for toxic metals due to lack of available data." Did I
2 read that correctly?

3 A. Yes, ma'am.

4 Q. All right. We're going to turn to Exhibit 74,
5 which is a copy of the development document. Mr. Alexander,
6 I've turned to page 2 of the document, which is No. TDEC
7 BRF 0000487; is that correct?

8 A. Yes.

9 Q. Can you please read the first sentence of
10 paragraph 4?

11 A. Paragraph 4. Bottom ash transport wastewater?

12 Q. Yes, Mr. Alexander.

13 A. "For bottom ash transport wastewater, there are no
14 BAT limits or pretreatment standards, with the exception of a
15 prohibition on PCB discharges. NSPS is revised to equal BPT.
16 The existing recycle requirement is withdrawn. The existing
17 BAT limits for conventional pollutants are withdrawn because
18 they will be covered by BCT."

19 Q. And, Mr. Alexander, can you please read just the
20 first sentence of the next paragraph, paragraph 5?

21 A. "For low volume wastes, the BAT limits for
22 conventional pollutants are withdrawn because they will be
23 covered by BCT."

24 Q. Okay. Mr. Alexander, let's turn to the next page.
25 Can you please read paragraph 7?

1 A. "BAT, NSPS, PSDS and PSNS are non-chemical metal
2 cleaning wastes, wet air pollution control devices, chemical
3 handling area runoff, and ash pile/construction area runoff
4 are reserved for future rulemaking."

5 Q. And, Mr. Alexander, does Bull Run have wet air
6 pollution control devices?

7 A. Yes.

8 Q. Mr. Alexander, if you would turn to page 248 of
9 this document, and I believe that it's an excerpt, not all of
10 the 664 pages of the entire document.

11 A. BRF 493?

12 Q. Yes. Mr. Alexander, can you please read the last
13 paragraph titled *Summary*?

14 A. "Summary - in general, data sufficient to
15 characterize waste loadings from flue gas cleaning processes
16 are not available. No net discharge data, i.e.,
17 influent/effluent data are currently available for those
18 systems. Additional studies will be needed to provide this
19 data and to confirm the current discharge practices in the
20 industry." That's still true today.

21 Q. And this statement was made in 1982; correct?

22 A. That's correct.

23 Q. Let's turn to page 488 of this document, which is
24 labeled TDEC BRF000973. And, Mr. Alexander, the top of the
25 page indicates that these comments apply to all wastewater

1 streams; is that correct?

2 A. That's what this page says.

3 Q. Please read the last sentence in paragraph 1-A.

4 A. "The agency is also withdrawing the BAT
5 limitations now in the Code of Federal Regulations for TSS and
6 oil and grease since those pollutants are now regulated under
7 BCT, not BAT."

8 Q. Okay. We're going to turn to Exhibit 75.

9 Mr. Alexander, what is the title of this document?

10 A. This is an excerpt from the Federal Register of
11 Friday, November 19, 1982.

12 Q. And as the Federal Register noted, that
13 accompanied the 1982 Effluent Limitation Guidelines?

14 A. I assume so.

15 Q. Mr. Alexander, can you read -- I'll read the title
16 and ask if it's correct. "Steam electric power generating
17 point source category; Effluent Limitation Guidelines,
18 pretreatment standards, and new source performance standards."
19 Did I read that correctly?

20 A. Yes, ma'am.

21 Q. I'm looking on the first column about halfway
22 down. It says, "EPA is reserving effluent limitations for
23 four types of wastewaters for future rulemaking. These four
24 waste streams are: Non-chemical metal cleaning wastes, flue
25 gas desulfurization waters, runoff from materials storage and

1 construction areas other than coal storage, thermal
2 discharges"; is that correct?

3 A. That's correct. It looks like EPA had studied
4 these and is placing these in limbo.

5 Q. And I turn to the page that's labeled on the top
6 as 52303 of the Federal Register notice; is that correct?

7 A. Yes.

8 Q. And in the far right column, there's a section
9 titled *Low Volume Wastewaters*; is that correct?

10 A. Yes. I see that.

11 Q. "The following 34 toxic pollutants are excluded
12 from national regulation because they are present in amounts
13 too small to be effectively reduced by technologies known to
14 the administrator"; is that correct?

15 A. That's correct. It appears that they looked at
16 the technologies that were available at the time and
17 determined that there was not sufficient information to set
18 effluent limitations for those 34 toxic pollutants.

19 Q. And it says that these toxic pollutants were
20 excluded from national regulations; is that correct?

21 A. Yes, ma'am. That means there was no regulation
22 being imposed in this rulemaking at this time.

23 Q. As we scroll down to the bottom of that page, do
24 these pollutants include arsenic, cadmium, chromium, cyanide,
25 and lead?

1 A. They do.

2 Q. Let's turn to the next page. Do they also include
3 mercury, nickel, selenium, silver, thallium, and zinc?

4 A. Yes, ma'am, they do.

5 Q. Thank you. When you prepared the Notice of
6 Determination, did you review an EPA memorandum regarding
7 NPDES permitting at steam electric power plants by James
8 Hanlon?

9 A. Yes, ma'am, I did.

10 Q. Let's turn to that. It's Exhibit 82. And just to
11 confirm, Mr. Alexander, is the memorandum I'm showing here the
12 one that you referred to in the Notice of Determination?

13 A. Yes, ma'am. I think there is -- this is only
14 partially present here. It appears that there's a second
15 attachment that's not present that was attached to the
16 original memo.

17 Q. And if you recall, is that attachment referring to
18 water-quality-based permitting?

19 A. Yes, ma'am. That's exactly right.

20 Q. And water-quality-based permitting is not at issue
21 in this appeal; is that correct?

22 A. That's correct.

23 Q. Mr. Alexander, this memorandum covers both
24 scrubber wastewater and ash impoundment; is that correct?

25 A. The memorandum does. The attachment specifically

1 refers just to scrubber wastewater.

2 Q. And the first paragraph of this letter states that
3 "the purpose of this memorandum is to provide you with interim
4 guidance to assist National Pollutant Discharge Elimination
5 System, NPDES, permitting authorities establish appropriate
6 permit requirements for wastewater discharges from flue gas
7 desulfurization, FGD, systems and coal combustion residual,
8 CCR, impoundments at steam electric power plants." Did I read
9 that correctly?

10 A. Yes, ma'am.

11 Q. And, Mr. Alexander, so this memorandum provides
12 guides to the NPDES permit writers like yourself; is that
13 correct?

14 A. Yes, ma'am.

15 Q. Let's turn to page 2. Mr. Alexander, can you
16 please read the first two sentences on page 2?

17 A. "In December 2008, an impoundment failure released
18 5.4 million cubic yards of coal ash at the Tennessee Valley
19 Authority's Kingston Fossil Plant in Tennessee, and a
20 subsequent release at TVA's Widows Creek Fossil Plant in
21 Alabama brought CCR storage and disposal into the national
22 spotlight."

23 Q. Thank you, Mr. Alexander. Let's turn to
24 attachment A, which begins on the next page. And its page is
25 labeled TDEC BRF 0004179; is that correct?

1 A. That's correct.

2 Q. And under the first paragraph, Background, it
3 begins, "In October 2009, the Environmental Protection Agency,
4 EPA, completed a study of wastewater discharges from the steam
5 electric power generating industry. EPA's Office of Water
6 evaluated wastewater characteristics and treatment
7 technologies, focusing to a large extent on wastewater from
8 flue gas desulfurization, FGD, air pollution control systems
9 and coal ash ponds, because these sources comprise a
10 significant fraction of the pollutants discharged by steam
11 electric power plants.

12 "Based on this study, EPA decided to begin a
13 rulemaking to address pollutants and waste streams not covered
14 by existing regulations issued in 1982," 40 CFR paragraph 423.
15 Did I read that correctly?

16 A. Yes, you did. Well done.

17 Q. Please turn to the next page. Mr. Alexander, can
18 you please read the first sentence?

19 A. "Where EPA has not promulgated technology-based
20 effluent guidelines for a particular class or category of
21 industrial discharger, or where the technology-based effluent
22 guidelines do not address all waste streams or pollutants
23 discharged by the industrial discharger, EPA must establish
24 technology-based effluent limitations on a case-by-case basis
25 in individual NPDES permits, based upon its best professional

1 judgment, or BPJ."

2 Q. Thank you, Mr. Alexander. Can you please read the
3 first line of the next paragraph beginning with "States
4 authorized"?

5 A. "States authorized to implement the NPDES program
6 act in the place of EPA for the purpose of issuing NPDES
7 permits to dischargers," 33 USC, paragraph 1342(b).

8 Q. Please continue.

9 A. "Although authorized states may include more
10 stringent restrictions than the federal program, an authorized
11 state must comply with specific minimum federal requirements
12 of the NPDES program," 40 CFR 123.25. "Therefore, an
13 authorized state must include technology-based effluent
14 limitations in its permits for pollutants not addressed by the
15 effluent guidelines for that industry," 33 U.S. Code, 1314(b),
16 40 CFR 122.44(a)(1), 123.25, 125.3.

17 "In the absence of an effluent guideline for these
18 pollutants, the CWA requires permitting authorities to conduct
19 the BPJ analysis discussed above on a case-by-case basis for
20 those pollutants in each permit."

21 Q. Please turn to the next page, and I'm going to
22 start with the second paragraph. This says, "The Steam
23 Electric Power Generating Effluent Limitation Guidelines and
24 Standards promulgated in 1982 include wastewater from wet FGD
25 systems under the catchall category of low volume wastes,"

1 40 CFR 423.11(b).

2 "However, the 1982 rulemaking did not establish
3 best available technology economically achievable (BAT) limits
4 for FGD wastewaters, because EPA lacked the data necessary to
5 characterize pollutant loadings from these systems." Did I
6 read that correctly?

7 A. That's correct. That's still true.

8 Q. And I'm going to read the final sentence of that
9 paragraph. "Accordingly, EPA determined that BAT limits for
10 the FGD waste stream were outside the scope of the rulemaking
11 and explicitly reserved the development of such limits for a
12 future rulemaking." Did I read that correctly?

13 A. Yes, ma'am.

14 Q. And I've turned to page 5, which is
15 No. TDEC BRF 0004183; is that correct?

16 A. I'm lost here.

17 Q. On the bottom of the page, if you scroll down, can
18 you read that now?

19 A. On page 5? Yeah, I got you, page 5.

20 Q. Page 5 of the Hanlon memo.

21 A. I see where you are.

22 Q. And, Mr. Alexander, can you please read the second
23 paragraph under item 4 starting with "Many power plants"?

24 A. "Many power plants combine FGD wastewater with ash
25 transport wastewater and/or cooling water prior to discharge,

1 which can result in FGD wastewaters being diluted by several
2 orders of magnitude prior to the final outfall.

3 "In addition, ash ponds typically contain a
4 variety of wastes, e.g., ash transport water, coal pile
5 runoff, landfill/pond leachate, et cetera, that when mixed
6 with the FGD wastewater may make the analysis to measure
7 compliance with FGD wastewater technology-based effluent
8 limits impracticable.

9 "Because of the high degree of dilution and the
10 number of waste stream sources containing similar pollutants,
11 NPDES permits may need to include effluent limits and
12 monitoring requirements on the internal FGD waste stream to
13 ensure effective control of the pollutants present in FGD
14 wastewater."

15 Q. Thank you. Mr. Alexander, that's quite a
16 mouthful. Now, at Bull Run does TVA mix its FGD wastewater
17 with other wastewater streams in the ash pond prior to
18 discharge?

19 A. Yes, indeed. That's been discussed at length this
20 morning and this afternoon.

21 Q. And, Mr. Alexander, in general, does TDEC impose
22 limits on internal wastewater streams when they are diluted?

23 A. We impose internal monitoring point monitoring for
24 multiple reasons. I'm not sure what you're getting at.

25 Q. Is one of those reasons because the pollutants

1 from a particular wastewater stream would be diluted at the
2 ultimate outfall to waters of the state?

3 A. That is correct. That's one of the reasons we do
4 that to that wastewater prior to dilution.

5 Q. But TDEC chose not to impose an internal limit of
6 the FGD wastewater at Bull Run, because you did not foresee
7 there to be an effluent guideline requiring that; is that
8 correct?

9 A. That's correct.

10 Q. And for purposes of evaluating best available
11 technology, you would want to know both the influent and the
12 effluent characteristics of FGD wastewater; is that correct?

13 A. That's correct, what we discussed earlier.

14 Q. And to get that influent data would require
15 internal monitoring of the FGD wastewater at Bull Run; is that
16 correct?

17 A. That's correct.

18 Q. But the permit did not require internal monitoring
19 of the FGD wastewater at Bull Run; is that correct?

20 A. That's correct, because we deemed that the limits
21 for that waste stream were not required.

22 Q. And I just want to clarify. The question I just
23 asked was not about a limit. It was about monitoring. So I
24 want to make sure you answer the right question. The permit
25 does not require internal monitoring of the FGD wastewater; is

1 that correct?

2 A. That's correct.

3 Q. And, Mr. Alexander, as we sit here today, it's
4 been about three years since the permit was issued; is that
5 right?

6 A. That's correct.

7 Q. And during this time, TVA has been collecting
8 additional data and providing this to TDEC; is that correct?

9 A. That is correct.

10 Q. And during this time EPA has published a draft
11 rule; is that correct?

12 A. EPA has posted a draft of a guideline, yes.

13 Q. And as we mentioned before, at least one other
14 state, Indiana, has issued a case-by-case BPJ limit; is that
15 correct?

16 A. If you're referring to the permit that you shared
17 with us prior to this hearing, yes, it was an Indiana permit
18 with the EPA analysis.

19 Q. And, Mr. Alexander, as you sit here today, do you
20 have enough information to conduct a BPJ analysis to set
21 limits at Bull Run?

22 A. Of course not.

23 Q. Okay. Let's turn to a different topic. This is
24 the best management practices provision. And I'm going to
25 turn back to the permit, which is Exhibit 1, specifically page

1 24. Mr. Alexander did you write the section titled *Part 4 -*
2 *Best Management Practices*"?

3 A. I created the original draft. It went through a
4 review process within my agency, yes.

5 Q. And did that review process include Mr. Janjic?

6 A. Yes, and Ms. Qualls.

7 Q. Mr. Alexander, was this section added to the final
8 permit as the result of the analysis you did in response to
9 comments?

10 A. Yes, that's correct.

11 Q. And, Mr. Alexander, this is relatively short. Can
12 you please just go ahead and read part 4 of the permit here?

13 A. Yes. "Best management practices, BMPs, are
14 incorporated as permit conditions to specifically address
15 controls on toxic metals in ash pond discharges. These
16 controls can be site-specific to BRF operations and practices
17 to address the circumstances of individual fossil plants.
18 Each practice must be developed and measured to document the
19 relationship between operations and effluent metals
20 concentrations.

21 "BMPs should be established based on guidance
22 shown in attachment 1, with submission of a BMP plan for
23 division review within 90 days following the permit effective
24 date."

25 Q. And the cite then refers to attachment 1, but that

1 was included in error; is that correct?

2 A. That is exactly correct.

3 Q. So the language here on page 24, excluding the
4 reference to attachment 1, is all the permit requires in terms
5 of BMPs?

6 A. That's correct.

7 Q. And when you wrote this language, you were just
8 trying to learn the starting point?

9 A. That's what I said in my deposition, yes.

10 Q. And, in fact, you included the language here about
11 developing and measuring processes in order to get a baseline
12 for the permit in the future; is that correct?

13 A. That is correct.

14 Q. And this provision does not describe that the BMP
15 plan must yield a reduction in the discharge of metals over
16 time; is that correct?

17 A. That's generally correct. What I also must say
18 about these operations and practices, that includes the
19 practices that they employ at the ash pond itself. And so the
20 operation of the treatment system is one of the practices
21 that's included here.

22 Q. And, Mr. Alexander, the permit BMP provision would
23 not necessarily be violated if the metals increased over time;
24 is that correct?

25 A. That is correct. As I explained in my deposition,

1 if the plant generation rate increases, if demand goes up and
2 Bull Run is activated on a pre-schedule, those numbers go up
3 and down based on the demand -- at the plant. So an increase
4 in the discharge doesn't automatically mean a violation of the
5 permit.

6 Q. Mr. Alexander, are you familiar with the EPA's
7 NPDES Permit Writers' Manual?

8 A. Yes, ma'am.

9 Q. Let's turn to that document. It's Exhibit 79, and
10 let's go ahead and turn to page 9-4. And, Mr. Janjic, section
11 9.1.2 -- I'm sorry, Mr. Alexander, section 9.1.2.2 addresses
12 BMPs in NPDES permits; is that correct?

13 A. That's correct. I could never be Mr. Janjic.

14 Q. And turn to page 9-6. Do you see that at the
15 bottom? That is 9-6; is that correct?

16 A. That's correct.

17 Q. And is this page the beginning of an example of
18 BMP plan requirements?

19 A. Yes, ma'am.

20 Q. And this example is about two pages long. It
21 includes seven sections. I'll show you this next page to see
22 if that's correct.

23 A. Yes. I have it here in the exhibits.

24 Q. So is it correct that it includes seven sections?

25 A. Yes, that's correct.

1 Q. And going back to the first page of Exhibit 9-1 in
2 the Permit Writers' Manual, one of the sections is titled
3 *Purpose*. Can you please read that section?

4 A. "Through implementation of the BMP plan, the
5 permittee must prevent or minimize the generation and the
6 potential for the release of pollutants from the facility to
7 the waters of the United States through normal operations and
8 ancillary activities."

9 Q. And, Mr. Alexander, does the Bull Run permit state
10 that TVA's BMP plan must minimize the release of pollutants to
11 waters of the United States?

12 A. I'm not sure if those exact words are in there as
13 we speak.

14 Q. Would you like me to turn back to the permit?

15 A. Ma'am, you asked if the plan had that in there, I
16 believe.

17 Q. Okay. Does the permit require TVA's BMP plan --
18 I'm asking about the permit requirement. Does the permit
19 require that TVA's BMP plan must minimize the release of
20 pollutants to waters of the United States?

21 A. Just give me one second, and I'll tell you.

22 Q. Okay.

23 A. Yes. The permit mentions the words "specifically
24 addressed controls on toxic metals and ash pond discharges".

25 Q. Does that say it needs to minimize release of

1 pollutants?

2 A. It's implied to me that controls on toxic metals
3 in ash pond discharges are minimizing pollutants, yes.

4 Q. So the requirements to minimize the release of
5 pollutants is implied by the permit?

6 A. Implied by this requirement for a best management
7 practices plan to identify the practices that do minimize
8 those pollutants, yes.

9 Q. Is there a reason you didn't put that language in
10 the permit itself?

11 A. Just my normal incompetence. That's the only
12 reason.

13 Q. I'm going to turn back to the Permit Writers'
14 Manual. And part 3 here is titled *Objectives*, and part C just
15 below that, can you please read that first sentence?

16 A. Under objectives, "The permittee must develop and
17 amend the BMP plan consistent with the following objectives
18 for the control of pollutants."

19 Q. And does the Bull Run permit state that TVA must
20 establish specific objectives for the control of pollutants?

21 A. Not explicitly in the wording of the requirement
22 for a BMP plan.

23 Q. Is that something else that you believe is
24 implied?

25 A. What I believe is that the plan that they gave us

1 was a very clear picture of the operating practices at that
2 plant and the factors that cause the metals concentrations in
3 the ash ponds to be what they are, and that was our intent.
4 We wanted that plan to spell that out.

5 Q. Okay. And, Mr. Alexander, we're almost done. Can
6 you please read the first sentence under part 4 *Requirements*?

7 A. "Requirements - the BMP plan must be consistent
8 with the objectives in the Objectives section above and the
9 general guidance contained in the publication entitled
10 *Guidance Manual for Developing BMPs*, EPA 833B-93-004, at that
11 website link or any subsequent revisions to the guidance
12 document."

13 Q. And, Mr. Alexander, are you familiar with this
14 guidance manual?

15 A. Generally, yes.

16 Q. And, Mr. Alexander, does the Bull Run permit
17 require TVA to develop BMPs consistent with this guidance
18 manual?

19 A. No, ma'am, it does not. And the next time we do
20 that, we will certainly put this reference in there.

21 MS. MATHENY: Thank you, Mr. Alexander.
22 Petitioners have no further questions at this time.

23 ADMINISTRATIVE JUDGE: Let's take a short
24 break, five minutes if possible. We'll be in a short recess.

25 (Recess taken.)

1 (BY THE ADMINISTRATIVE JUDGE) If we're
2 ready, we can take our seats, and we'll begin again.
3 Mr. Alexander, if you'll remember, you're under oath.

4 THE WITNESS: Yes, ma'am.
5

6 **CROSS-EXAMINATION**

7 **BY MR. PARKER:**

8 Q. Mr. Alexander, I want to go to the email from Ron
9 Jordan. I believe that's Exhibit 90, if I'm correct on that.

10 A. 95.

11 Q. No. 95. Now, what you were trying to do in this
12 email was trying to get more information from EPA to do the
13 BPJ BAT analysis; correct?

14 A. Oh, yes. That's the whole question here is when
15 you start researching this, and you see from this '82
16 development document all those factors that go into making the
17 wastewater from an ash pond have certain kinds of
18 concentration of metals. They say that it all originates from
19 the coal.

20 So the question here was, well, can you tell us
21 more about that. We believe Bull Run burns eastern
22 bituminous, so what do you know about eastern bituminous that
23 makes the metals what they are?

24 Q. You also tried through email and maybe by phone
25 calls to get other information from EPA; is that correct?

1 A. Yes. We tried and --

2 Q. Did EPA ever respond to any of your requests?

3 A. No, sir. I'm sorry to say they were too busy
4 doing other things. We got zero help from EPA in this whole
5 process.

6 Q. You talked about -- there was some discussion
7 about the technology in 1982 that was considered in the ELG.
8 Physical/chemical and biological treatment both existed in
9 1982; is that correct?

10 A. I'm sure physical/chemical was discussed. I just
11 don't remember biological.

12 Q. I asked you did it exist.

13 A. Did it exist in '82? I just don't --

14 Q. The technologies.

15 A. The technologies existed, but I'm not sure the
16 extent to which biological was an accepted method of removing
17 metals in the '82 guidelines. I just don't recall.

18 Q. Okay. When we're doing a case-by-case TBEL, we're
19 not trying to tell people what the technology is. We're
20 telling them what the number is that they've got to meet; is
21 that correct?

22 A. That is exactly true.

23 Q. And a case-by-case TBEL analysis can have no limit
24 as an outcome; is that correct?

25 A. That is absolutely true. We say the effluent

1 guideline is a number and expressed as a concentration in the
2 wastewater or a mass loading in the wastewater. And we select
3 that number based on what we think that number represents the
4 performance of a wastewater treatment technology. And if the
5 best technology is known to produce effluent with a certain
6 numerical limit, that's the limit we put in. But the way the
7 permittee accomplishes that, that's his choice, his or her
8 choice.

9 Q. In doing a BPJ analysis, the factors can be
10 weighted differently; is that correct? I mean, it's not
11 weighted any certain way?

12 A. There is no ranking of the factors; that's
13 correct. And the references that we were shown earlier today
14 go on and on about how EPA and states can use their discretion
15 in making their selection of which factor is dominant.

16 Q. Now, I'd like you to -- let's go to page 5 of
17 Exhibit 74, please.

18 A. The one that says *Final Regulations*?

19 Q. Part 5 in *Regulations* talks about a specialized
20 definition. And if you could, in (b) the term "low volume
21 waste sources", that includes wastewaters from wet scrubber
22 air pollution control systems; correct?

23 A. That's what it says right here.

24 Q. And an FGD system is a wet scrubber air pollution
25 control system; correct?

1 A. That's correct. The FGD term was just being used.

2 Q. Turning to page 267 -- 265 first, and this is the
3 section that talks about low volume wastewater; correct?

4 A. That's correct.

5 Q. And, by definition, that includes the wet air
6 pollution; correct?

7 A. That's correct.

8 Q. Okay. Go to page 267 real quick. And it says,
9 "The following 34 pollutants are excluded from national
10 regulation because they are present in amounts too small to be
11 effectively reduced." And those exclude those metals that
12 Ms. Matheny got you to read out; correct?

13 A. That is correct.

14 Q. So those pollutants were considered; correct?

15 A. That's what it says.

16 Q. But EPA just chose to exclude them. Because they
17 were considered, is that ELG applicable --

18 A. Well, of course.

19 Q. -- to these waste streams?

20 A. Of course. That's the whole point here is that if
21 EPA knew in 1982 what the best available technology for these
22 kinds of wastewaters was the best technology to choose, and
23 the effluent limits that would come from that type of
24 wastewater treatment, they would have said so.

25 Q. Let's talk about the Merrimack permit real quick,

1 and we don't have to bring that up. You can take that down.
2 The Merrimack scrubbers, they're recycled scrubbers; is that
3 correct?

4 A. That is correct. That's what we understand.

5 Q. And the Merrimack permit, we've been talking as it
6 is a permit. What we are talking about is a draft permit?

7 A. That I understand is -- if you look at the website
8 this week, it shows it as a draft permit.

9 Q. And that's 2010; correct?

10 A. That is correct.

11 Q. And there hasn't been a final permit issued on
12 there; right?

13 A. As of yesterday's website, it showed that they had
14 recently made changes to the draft permit still again.

15 Q. Okay. I want to go to the Hanlon memo, which is
16 82, and I want to go to the disclaimer at the end of the memo
17 part. Could you read the first three or four sentences of
18 that into the record, please.

19 A. Yes. "This guidance document does not change or
20 substitute for any legal requirements, though it does provide
21 clarification of some regulatory requirements. While EPA has
22 made every effort to ensure the accuracy of the discussion in
23 this document, the obligations of the regulated community are
24 determined by the relevant statutes, regulations, or other
25 legally binding requirements. This guidance document is not

1 legally enforceable and does not confer legal rights or impose
2 legal obligations upon any member of the public, EPA, states,
3 or any other agency."

4 That's the whole issue that we have about trying
5 to enforce EPA memos. It's our rule.

6 Q. If you would, read the sentence that says, "This
7 guidance may not".

8 A. "This guidance" -- let's see --

9 Q. About halfway down.

10 A. "This guidance may not apply in a particular
11 situation based upon the circumstances, and EPA, states, and
12 Tribes retain the discretion to adopt approaches on a
13 case-by-case basis that differ from the recommendations of
14 this guidance document where appropriate." Is that what
15 you're talking about?

16 Q. Correct. Then read the next sentence. Just read
17 the rest of it.

18 A. "Permitting authorities will make each permitting
19 decision on a case-by-case basis and will be guided by the
20 applicable requirements of the Clean Water Act in implementing
21 regulations, taking into account comments and information
22 presented at that time by interested persons regarding the
23 appropriateness of applying these recommendations to the
24 particular situation.

25 "In addition, EPA may decide to revise this

1 guidance document to reflect changes in EPA's approach to
2 implementing the regulations or to clarify and update text."

3 Q. And did you know, Mr. Alexander, that up until
4 2010 you couldn't get a sample of untreated FGD wastewater
5 prior to entering this area -- or prior to entering the
6 settling pond, because the pipe was underwater? Did you know
7 that?

8 A. I was made aware of that, yes. But also -- yeah,
9 that's right. I started to get confused about the 2010 change
10 from sluicing fly ash. That's correct.

11 MR. PARKER: That's all I have.

12 ADMINISTRATIVE JUDGE: TVA?

13 MR. STAGG: TVA has no questions.

14 ADMINISTRATIVE JUDGE: Okay. Questions
15 from the Board?

16 MR. HEAD: I have some.

17 MR. UNGER: I just have a simple question.
18 Is cost a factor in identifying the best available
19 technology --

20 COURT REPORTER: I can't hear you.

21 ADMINISTRATIVE JUDGE: We need the board
22 members to speak closer into the microphone. That would be
23 great.

24 COURT REPORTER: Thank you.

25 MR. UNGER: Is cost a factor in

1 identifying the best available technology?

2 THE WITNESS: Exactly. It is indeed.

3 MR. UNGER: Is efficiency of the treatment
4 system a factor in applying the best available technology?

5 THE WITNESS: Well, sir, when you speak of
6 efficiency, that's like the percentage of the pollutant that's
7 reduced. We really usually don't always base our judgment of
8 the best treatment technology on the efficiency. It might be
9 which one could get that concentration down to the lowest
10 level as opposed to what the efficiency is.

11 MR. UNGER: And at the time of the permit
12 writing, was any of that information available from EPA?

13 THE WITNESS: We couldn't hang our hat on
14 anything that said that physical/chemical is the best or a
15 treatment pond is the best or evaporation is the best, best
16 meaning it had the best efficiency or performance and it cost
17 the cheapest. If we knew that, we wouldn't be here today.

18 MR. UNGER: Okay. That's all I have.

19 THE WITNESS: Thank you, sir.

20 MR. HEAD: Mr. Alexander, I have several
21 questions. The first thing I want to make sure I understand
22 is that the question here today was written and, I guess,
23 finalized on September 30th of 2010; is that correct?

24 THE WITNESS: Correct.

25 MR. HEAD: Okay. Now, my first question

1 is, you contacted EPA and tried to find out about best
2 available treatment technologies and costs of as you were
3 preparing this permit.

4 THE WITNESS: That's correct.

5 MR. HEAD: Did you get anything from EPA
6 that indicated -- or any information from EPA that you could
7 use for making the permitting recommendation for the
8 Department?

9 THE WITNESS: Not very much, sir. I can't
10 disparage EPA totally. But one of the things that we were
11 really searching for that we didn't get is an example of one
12 of these analyses that it might have been done, say, for the
13 metal finishing waste category or the inorganic chemical waste
14 category.

15 I mean, someone who had done a BPJ
16 analysis like this that said, "Well, the effluent guideline
17 doesn't spell out exactly what the best available technology
18 is, but here's a way you could follow that example to use,
19 say, another industrial category to get that." And EPA just
20 never would find that for us, and so we are sort of plowing
21 new ground here.

22 MR. HEAD: You made mention of some
23 information that you thought EPA had regarding cost. You said
24 something to the effect that it was deemed to be -- I guess
25 the terminology is proprietary, because it was provided to EPA

1 by industry. And because of that, even if EPA had that type
2 of information, they couldn't release that to you, could they?

3 THE WITNESS: Well, a big part of the
4 current effluent guidelines that are out for review now is
5 volume of cost and treatment performance information that
6 would be the exact basis for how you would select BAT. And in
7 that manual, it keeps referring to all of that information
8 that's in the appendix.

9 Well, if you go to the appendix, all of
10 that is redacted as confidential business information. And so
11 when the rules say that for certain types of scrubbers, they
12 do say that the very large scrubber like Cumberland has,
13 Cumberland Fossil is one of the largest plants in the EPA
14 system, and it has a large scrubber. They say, we've
15 determined that the effluent guidelines should have these
16 numeric metals limits based on a physical/chemical treatment
17 technology. We've made that decision.

18 But on the size of the scrubbers for Bull
19 Run and Kingston, it says that the state permit writers have
20 got to evaluate that on their own best professional judgment.
21 And that performance and cost data that's in the appendix,
22 well, by the way, you can't have that. So I don't know what
23 we'll do if it passes that way.

24 MR. HEAD: So basically you've had this
25 report from EPA since 2009. But the background data --

1 THE WITNESS: The background data in the
2 2009 report was mostly on treatment performance. It didn't
3 really say what the cost decision would be on BAT.

4 MR. HEAD: Now, there was a reference made
5 to the EPA NPDES permitting guide. When that was shown, I
6 noticed that it was dated October of 2010; is that correct?

7 THE WITNESS: Yes, sir. I think that's
8 the latest EPA update on that. There's not been a whole lot
9 of rule changes on how permits get written since then.

10 MR. HEAD: But did you have any access to
11 that information when you were preparing the permits that were
12 issued on September 30th of 2010?

13 THE WITNESS: Yes, sir.

14 MR. HEAD: So you did have that document?

15 THE WITNESS: Yes, sir. The permit
16 writers' guide is what we've been taught to use.

17 MR. HEAD: The one that was issued in
18 October 2010?

19 THE WITNESS: Yes, sir.

20 MR. HEAD: There was mention made of a
21 flue gas desulfurization NPDES permit for Merrimack. When I
22 saw that on the screen, you also had a date of October 2010.
23 Did you have access to that before you made this decision --

24 THE WITNESS: No, sir. That wasn't
25 available.

1 MR. HEAD: -- or before you made the
2 recommendation?

3 THE WITNESS: No, sir. That wasn't
4 available until after we had already gone through the
5 permitting process.

6 MR. HEAD: And then I think there was also
7 a reference to the Indiana -- permit for Indiana, or in
8 Indiana, pardon me -- to have a permit of a similar type. Do
9 you know when that permit was issued?

10 THE WITNESS: Yes, sir. That's a 2013
11 permit just recently issued.

12 MR. HEAD: Okay. Did you have any
13 knowledge of the terms and conditions of that permit when you
14 were making a recommendation on this permit in September of
15 2010?

16 THE WITNESS: No, sir. We had no other
17 example of a BPJ analysis like the one we needed to draw from.

18 MR. HEAD: So from your perspective, you
19 reached out and asked for assistance on this particular permit
20 issue, and the sources that you contacted provided you with no
21 additional information, and things that you mentioned here
22 today were things that occurred after the permit was issued.
23 So you had no knowledge of it?

24 THE WITNESS: In many cases, yes, sir,
25 that's true.

1 MR. HEAD: The permit in question, the
2 effluent from Outfall 001 is for several combined wastewater
3 streams; is that correct?

4 THE WITNESS: Yes, sir. That's true.

5 MR. HEAD: If you were looking at this
6 particular discharge, what percentage of the flow that's being
7 treated by the ponds comes from the flue gas desulfurization
8 treatment system?

9 THE WITNESS: Probably less than 20
10 percent.

11 MR. HEAD: And when you issued or when you
12 made a recommendation to issue this permit, it was for all of
13 the combined wastewaters coming into that treatment system?

14 THE WITNESS: Yes, sir. You know they
15 applied in 2007 for this renewal. Then we picked it up after
16 the Kingston event and began actively pursuing the renewals in
17 2009 and 2010, and so there were some changes along the way,
18 as we heard this morning. But that is correct.

19 MR. HEAD: And if there were significant
20 modifications by TVA at this facility for a substantial amount
21 of wastewater that was currently going into this treatment
22 facility was no longer going into that, would they be
23 required, pursuant to permit modification, to cut a change in
24 the volume and types of wastewater going into the system?

25 THE WITNESS: It's possible. We could --

1 yes, sir, that is one possibility. They could have applied
2 for a permit modification.

3 MR. HEAD: And based on the results from
4 the DMR guides received over the last three years, do you
5 think that the system is effectively treating the effluent
6 before it goes into a stream?

7 THE WITNESS: There's no doubt about it,
8 sir. The numbers that we're seeing are based on the
9 measurements of the metals' concentrations. Those numbers are
10 clean enough that you could practically put that effluent into
11 a zero flow stream, and fish and the other aquatic life would
12 be protected, and our air quality criteria would be met.

13 MR. HEAD: I recall during some of the
14 questions that you were answering, there was a point brought
15 up about the testing that's required under this permit. I
16 believe it's 4 --

17 THE WITNESS: That's exactly right.

18 MR. HEAD: And the purpose for that
19 monitoring, does it determine the entire impact of the
20 effluent going into the stream? It would take into account
21 not only the constituents going into the stream from the
22 effluent but also synergistic effects that might happen
23 because of the combination?

24 THE WITNESS: Yes, sir. That's the magic
25 word, "synergistic". You know, you might have concentrations

1 that approach but not be above a criteria for a certain
2 reason. But, in total, all of those things might be toxic to
3 aquatic life in the receiving stream, and that's exactly why
4 we do a whole level of toxicity tests like that. It's sort of
5 a catchall umbrella that says, is this toxic to anything or
6 not.

7 MR. HEAD: And just to make sure I
8 understand, what you're talking about is a hundred percent
9 effluent, no dilution?

10 THE WITNESS: That's right. That's what
11 the permit requires.

12 MR. HEAD: And my last question is, to
13 your knowledge, has the discharge from this facility in
14 Outfall 001 caused any change in the stream use classification
15 for the --

16 THE WITNESS: To my knowledge, no. That
17 stream is classified for drinking water supplies, and that use
18 is still protected as we speak.

19 MR. HEAD: Thank you.

20 MR. HALCOMB: Mr. Alexander, my name is
21 Monty Halcomb, and I'm a member of the board. I didn't pick
22 up on this during your testimony. What is your specific
23 position?

24 THE WITNESS: I'm a NPDES permit writer in
25 the water quality branch.

1 MR. HALCOMB: How long have you been in
2 that position?

3 THE WITNESS: Ten years this month.

4 MR. HALCOMB: What is your background and
5 experience academically and also work-wise?

6 THE WITNESS: I'm a civil engineer, B.S.
7 civil engineer, master's in environmental engineering, and
8 I've done just about everything that you can think of to make
9 a buck.

10 MR. HALCOMB: You've been in your current
11 position for ten years. What did you do prior to that?

12 THE WITNESS: I was self-employed for a
13 while. Before that I worked as an environmental consultant, a
14 consultant engineer working on various kinds of -- a lot of
15 petroleum remediation. And prior to that, I worked at the
16 Marine Corps base at Camp LeJeune as the base environmental
17 engineer.

18 MR. HALCOMB: All right. Thank you.
19 Would it be accurate or inaccurate to say that what may be the
20 best technology used at one plant may not be the best
21 technology used at all plants? I mean, there could be
22 differences that might have one choose to use some type of
23 technology different than, say, a plant in Indiana or a plant
24 in Arkansas or Alaska, New York, depending on where there's
25 urban or close to urban areas versus rural areas. Go ahead.

1 I'll let you answer the question.

2 THE WITNESS: Well, sir, I think that's
3 very obvious in our documentation here is that when we went
4 into this study, trying to find out these answers, we
5 determined that the recipe for this wastewater is so variable,
6 based on the kind of water you pull out of the river to make
7 steam out of and then cool it down and discharge from the coal
8 that's there, from what you do to the coal while you burn it,
9 what you burn it in, how you control the air pollution
10 decides. All of those things are part of that recipe. And so
11 type of treatment technology that's used on that wastewater
12 can vary.

13 Now, there's some -- every wastewater
14 system that we know of is designed to treat changes every day
15 in wastewater flow. So you've got some common things that
16 you've got to address, but one size does not fit all.

17 MR. HALCOMB: Would there be any
18 differences, in your opinion, in best management practices or
19 choosing whatever would be the best available technology based
20 upon the hours or days of operation of one plant, and I think
21 this one was like two months, versus those plants that are
22 being operated for 12 months?

23 THE WITNESS: Well, sir, not as
24 significant in the industrial wastewater treatment that we're
25 talking about here, because it's inorganic. It's not

1 biologically -- you know, you're not depending on that
2 wastewater system to keep those bugs alive until you feed it
3 the new waste. And these inorganic things, you can start and
4 stop those a whole lot easier.

5 But what we've seen, one of the big things
6 that we've noticed in these three years of effluent data that
7 we've gotten from Bull Run is that during those high-demand
8 times when the plant is really cranking out the megawatts, if
9 you look at the effluent metals concentration that happened
10 three or four months before that coming out of the pond and
11 the effluent concentrations coming out during those three or
12 four months of high demand, there's not that much difference.

13 So that pond system is affected
14 year-round, no matter what the plant is doing.

15 MR. HALCOMB: Okay, two more questions.
16 One, what do you think TDEC -- or what would you do if one of
17 those water samples came back with a higher level of mercury
18 or selenium than EPA considered safe?

19 THE WITNESS: I'd resample it.

20 MR. HALCOMB: And then what if it came
21 back high?

22 THE WITNESS: Well, I'd compare that,
23 first of all, to the reasonable potential analysis that we did
24 to see is it high enough that it could have affected what's in
25 the river. As we mentioned earlier, there's a lot of room

1 between what the plant is putting out, month in and month out,
2 and what we project is the worst case that could hurt the
3 river. So I would have to see how close to that upper limit
4 that it was getting.

5 MR. HALCOMB: What if it was over the
6 upper limits?

7 THE WITNESS: Well, then we're going to
8 have a serious conversation about what needs to be done. If
9 that is a valid test, and there's no question about the
10 validity of the data, we're going to have to see what's
11 causing that plan. That's what the purpose of the BMP plan is
12 to do is to tell us all the factors that make up that recipe
13 for your wastewater so we can go back and see which one of
14 those ingredients is off.

15 MR. HALCOMB: And my last question, would
16 you amend the plant's existing permit prior to its renewal
17 date if they knew the best available technology came out?

18 THE WITNESS: Like if EPA had finalized
19 the rules?

20 MR. HALCOMB: Correct. Let's say the
21 plant is operating, and they're operating using, at that time,
22 the best available technology. Then halfway through the
23 permit period, there's a new technology that comes out that's
24 even better than what they're using at that point. Would you
25 amend the permit?

1 THE WITNESS: That's a tough call, because
2 you're changing horses in the middle of the stream after
3 you've required a permittee to make a huge investment in, in
4 the wastewater technology. You can only do that for a darn
5 good reason.

6 MR. HALCOMB: And the cost factors are
7 also considered?

8 THE WITNESS: Correct. Now, every permit
9 we issue has a re-opener clause in it that says, if at some
10 point EPA decides that there's going to be a best available
11 technology decision that's issued, we get to reopen that
12 permit for that very reason, because times are always
13 changing.

14 MR. HALCOMB: But you also have the
15 authority to reopen that permit whether EPA does or not;
16 right?

17 THE WITNESS: That is correct.

18 MR. HALCOMB: Thank you.

19 MR. McCLURKAN: Just one question.
20 Regarding the original permit, the way I understand this, is
21 that this permit was written using the effluent limitation
22 guidance from 1982 --

23 THE WITNESS: Yes, sir.

24 MR. McCLURKAN: -- which did not require
25 the BPJ analysis initially. What transpired to make you --

1 while the permit was issued and on notice or a draft permit,
2 how was the decision made to go ahead and do the BPJ analysis?

3 THE WITNESS: Yes, sir. During the public
4 comment period, there was substantial comment received from a
5 consortium of environmentalist interest groups. And the
6 thread of that comment was that you need to examine
7 technology-based limits, because EPA hasn't done that.

8 And, in fact, we even got a letter from
9 Region 4 that said, you ought to look at these
10 technology-based limits. And the comments were also made that
11 you've got to do a best professional judgment analysis,
12 because this is a case-by-case situation that isn't covered in
13 the rules.

14 And, quite frankly, we thought we had told
15 that story well enough in the past, but apparently the
16 comments were of such a nature that we felt like it was our
17 duty to go through that process and use that same analysis,
18 look at every one of those factors, the age and the process
19 and all that. We felt like if that's what the commenters are
20 asking for, then that's our duty to respond to that. That's
21 why we did it.

22 MR. McCLURKAN: Thank you.

23 THE CHAIRMAN: I think you've already
24 answered my question when you were talking with Mr. Head. But
25 it's my understanding, based upon your testimony,

1 Mr. Alexander, that the permit that you wrote and BMPs that
2 were implemented, in fact, did control the concentration of
3 toxic metals in this discharge?

4 THE WITNESS: Well, sir, the permit
5 doesn't control anything.

6 THE CHAIRMAN: Well, it allows for BMPs.

7 THE WITNESS: Yes, sir. I'm talking about
8 the physical control. What we tried to do is to do the best
9 we could to say what the rules called for at the time, and we
10 just couldn't formally say that the State is going to require
11 TVA to put in X kind of wastewater treatment with these
12 numbers coming out the end of the pipe without having solid
13 numbers to back that up with.

14 MS. MANNERS: I just have one question
15 about internal monitoring .5 dischargers throughout Outfall
16 001. I understood Patrick to say that the flue gas
17 desulfurization discharge was underwater and couldn't be
18 handled. So why is this internal monitoring point required in
19 this permit?

20 THE WITNESS: I believe -- I checked that.
21 I think that is the Kemp pond -- let me double-check that
22 right quick. Yes, ma'am. Internal monitoring .5 is a
23 carryover from the previous permit, and that's for the metal
24 cleaning waste pond. That waste stream is specifically called
25 out in the Effluent Limitation Guidelines for steam electric

1 facilities.

2 And it says that if you're going to do
3 this metal cleaning, which they flush the pipes with acid, or
4 whatever they do to clean those pipes, and you take those
5 wastewaters out in a separate waste stream, you've got copper
6 and iron limits that you've got to meet from the '82 effluent
7 guidelines. That's always been the case.

8 So we said, the only way that you can
9 prove that you're meeting what those effluent guidelines said
10 before you put all this into this huge ash pond and it gets
11 diluted is that you've got to monitor that.

12 MS. MANNERS: And just a follow-up from
13 that. Because the FGD effluent use of that pond was
14 underwater at the time, it couldn't be monitored, and dilution
15 isn't dilution from the discharge, will the new permit require
16 the same monitoring point to be included?

17 THE WITNESS: Well, if I understand you
18 clearly, internal monitoring .5 has gone away, because that
19 pond has gone away. We don't have that discharge anymore.
20 That's been a part of this pond closure. That was one of the
21 quickest, easiest ways, and I think TVA actually does their
22 metal cleaning in a way that they capture that, and they send
23 it off for treatment someday. They don't put that in the
24 river anymore.

25 In the new permit, what we'll do in regard

1 to the FGD waste stream is really yet to be determined. There
2 are so many things happening at one time. I could waste your
3 all's entire afternoon talking about the possibilities, but
4 that's not the right thing to do.

5 MS. MANNERS: So we don't know?

6 THE WITNESS: We do not know.

7 MR. DALES: I just have one question.
8 Cost keeps coming up. I've heard it twice. The Merrimack
9 situation, I think you said, is still in the draft phase,
10 recently updated, I think you said. Has there been any change
11 in the cost? Has it increased, the maintenance and the
12 initial estimates that we saw?

13 THE WITNESS: I don't think so. I think
14 that was a deal where that electric utility company didn't put
15 that treatment technology in because EPA or the State told
16 them to. They went ahead and did that sort of on their own,
17 didn't have the limits. And that's a big part of the
18 discussion there, is that they sort of went out on a limb
19 thinking that they were guessing right. It was a substantial
20 thing, to spend tens of millions of dollars to do that.

21 And I don't say many good things about TVA
22 sometimes, but one thing I do say is that their engineering is
23 very solid, and I don't believe they would do that. I think
24 their attention to the cost that we pay is probably a little
25 bit more serious than that. I don't see them doing that.

1 They're going to want to be sure that whatever the cost that
2 we get charged for the wastewater treatment is going to be
3 justifiable.

4 MR. DALES: Thank you.

5 ADMINISTRATIVE JUDGE: Ms. Matheny?

6

7

REDIRECT EXAMINATION

8 **BY MS. MATHENY:**

9 Q. Mr. Alexander, I have just a few questions. Would
10 you please turn to Exhibit 76 in the large binder. It's
11 towards the back. Are you there?

12 A. Yes, uh-huh.

13 Q. Mr. Alexander, is this the EPA 1996 NPDES Permit
14 Writers' Manual?

15 A. Yes, ma'am, I think so.

16 Q. So when you wrote this permit, there was an EPA
17 Permit Writers' Manual?

18 A. Yes, ma'am, there was.

19 Q. Okay. I believe I heard you say earlier about
20 somewhere less than 20 percent of the wastewater at Outfall
21 001 is scrubber wastewater; is that correct?

22 A. By volume, yes, ma'am.

23 Q. So doesn't that mean that the FGD scrubber
24 wastewater is substantially diluted at Outfall 001?

25 A. Yes, ma'am.

1 Q. Regarding the best management practices plan, did
2 TDEC approve of the practices that TVA was already using?

3 A. I will say yes to that, because what the best
4 management practices plan did was essentially document the
5 things that were going on in the recent years at the plant.

6 Q. So in other words, TVA didn't change anything it
7 was already doing at Bull Run because of the BMP plan; is that
8 correct?

9 A. The way I would look at it is, what TVA was doing
10 at the Bull Run plant was changing from one quarter to the
11 next, had been for two or three years, and has changed ever
12 since then. It's one of the most dynamic situations that we
13 see in Tennessee in trying to define what's happening at an
14 industrial wastewater plant that's totally redeveloping
15 itself.

16 Q. And TVA can change the process without violating a
17 permit; is that correct?

18 A. There is a provision under part 2 of the permit
19 called *Plan Changes*, and this is a thing that we --
20 flexibility that we allow every industrial discharger that, if
21 they are making process changes in the plan that don't really
22 affect the wastewater being discharged into the stream, we
23 require them to notify us. If it is going to be significant,
24 we require them to notify us. So there's that feedback loop
25 that we have in every permit that attracts those kinds of

1 changes.

2 Q. And I believe I heard you discuss the last three
3 years of effluent data, and I believe I heard you say that the
4 ponds are removing pollutants; is that correct?

5 A. Yes, ma'am, that's correct.

6 Q. And these pollutants the ponds are removing, to
7 some extent, include toxic metals?

8 A. Yes, they do.

9 Q. So are these pollutants present in the untreated
10 coal combustion wastewater and treatable concentration?

11 A. That's correct.

12 Q. And I have one last question, which is, if TDEC
13 issued a permit to TVA now requiring a BAT-based effluent
14 limit, and then EPA issues final guidance, will TDEC reopen
15 that permit based on what you know from the draft ELGs?

16 A. I'm going to answer that like this. Based on the
17 legal decision that TVA is operating under now, vis-a-vis the
18 settlement of a lawsuit, I think it was North Carolina sued
19 multiple states. I don't know exactly how to describe it.

20 But there's a federal lawsuit consent, that you
21 know better than I about, that says at the time the effluent
22 guidelines are finalized, TVA agrees to reapply for all their
23 permits based on what those new guidelines say they've got to
24 do. They have 12 months from the time those guidelines are
25 finalized until TVA has to reapply. This coming July, if the

1 rules are finalized then, TVA has got 12 months to reapply for
2 all their permits.

3 As we've heard said today, if those rules are
4 stayed and there's lawsuits for ten years, then that reason
5 for TVA to reapply won't happen. We believe that TVA's
6 process, from our discussions with their staff, will follow
7 along with permit renewal applications six months ahead of the
8 expiration dates, just as though those guidelines aren't
9 final.

10 So it's difficult to say today at what point all
11 this will happen, but we know that there is the certainty of
12 TVA's response to the federal consent decree, and we know of
13 their ongoing practice to reapply, as they normally would,
14 pending permit expiration. So whichever of those comes first
15 is what we would see happen, I suppose. Does that ...

16 Q. And I have a follow-up or two. My question
17 actually wasn't about TVA submitting a new application. My
18 question was, will TDEC reopen the permit if EPA finalizes it
19 in the Effluent Limitation Guidelines?

20 A. I'm going to say most likely.

21 Q. I want to be clear about what I just heard you
22 say. If, in fact, the ELG is delayed or it is issued and
23 stayed, would TDEC reopen the permit and conduct a BPJ
24 analysis to set BAT limits?

25 A. I'm just a permit writer. I only work here. That

1 would be a management decision.

2 MS. MATHENY: Okay. I have no further
3 questions for this witness. Thank you, Mr. Alexander.

4

5

RECROSS-EXAMINATION

6 **BY MR. PARKER:**

7 Q. You were in the room when Mr. Hixson testified
8 about the BMP plan in relation to questions about adding
9 chemical coagulants and that that was something new that
10 happened as a result of the BMP plan?

11 A. I was in the room.

12 Q. So that's something new they are doing as a result
13 of the BMP plan; correct?

14 A. I believe that is true, yes, the timing of things.
15 I think that is correct. There's a new factor in that
16 chemical coagulation that they do in the ponds that makes the
17 suspended solids out of those ponds as good, practically --
18 well, as good as any domestic wastewater treatment plant that
19 we have in Tennessee. The solids are practically zero.

20 MR. PARKER: Thank you.

21 ADMINISTRATIVE JUDGE: Anything from TVA?

22 MR. STAGG: TVA has no questions.

23 ADMINISTRATIVE JUDGE: Anything more from
24 the Board? This witness is excused. Thank you so much for
25 your testimony. Mr. Chairman, your preference at this point

1 to start with the next witness or --

2 THE CHAIRMAN: We've got 30 minutes or so.
3 Let's see what we can get done.

4 ADMINISTRATIVE JUDGE: Okay.

5 MS. MATHENY: I'd like to call Mr. Janjic.

6

7

VOJIN JANJIC,

8 having been first duly sworn, was examined and testified as
9 follows:

10

DIRECT EXAMINATION

11 BY MS. MATHENY:

12 Q. Good afternoon, Mr. Janjic. As you know, I'm
13 Stephanie Matheny.

14 A. Correct. Hello, Ms. Matheny.

15 Q. Can you please state your name for the record.

16 A. Vojin Janjic. That's V-o-j-i-n, J-a-n-j-i-c.

17 Q. And, Mr. Janjic, what is your position at TDEC?

18 A. I'm a manager of the water-phase systems unit,
19 which used to be a permit section in the division of water
20 resources.

21 Q. And just to clarify, other than for mining, you
22 oversee all of TDEC's NPDES permitting; is that correct?

23 A. That is correct.

24 Q. And I'm going to ask a quick follow-up question.

25 If the ELG is delayed, will TDEC reopen the permit and oppose

1 BPJ-based BAT limits?

2 A. Typically, when new Effluent Limitation Guidelines
3 are introduced by the federal government, those include
4 schedules of compliance. We will see what the final Effluent
5 Limitation Guidelines say, and depending on the schedule of
6 compliance, and depending where in the permit cycle.

7 As you know, NPDES permits are issued for five
8 years maximum. Depending where we are in the permit cycle,
9 we'll make a determination whether Effluent Limitation
10 Guidelines will be incorporated in the next permit cycle or
11 the permit needs to be modified or revoked and reissued.

12 Q. And, Mr. Janjic, I believe you just answered what
13 would happen if the ELG was issued in final form; is that
14 correct?

15 A. That is correct.

16 Q. The question I had asked is, if the ELG is further
17 delayed or stayed, would TDEC reopen the permit and oppose
18 BPJ-based BAT limits?

19 A. I think it would be irresponsible for us to change
20 anything. The permit is based on draft Effluent Limitation
21 Guidelines.

22 Q. So is that a no, Mr. Janjic?

23 A. That's a no.

24 Q. Thank you. Mr. Janjic, can you briefly describe
25 your role in permits?

1 A. My role?

2 Q. Your role.

3 A. My role was to help review the permit application,
4 draft permit, correspondence with the permittee and interested
5 third parties during the issuance of the permit, draft permit
6 public comment period, public notice period, following the
7 permit issuance coordinate any permit appeal activities.

8 Q. And, Mr. Janjic, you reviewed the draft of the BPJ
9 section that was included in the final permit and provided
10 that to Mr. Alexander; is that correct?

11 A. Yes.

12 Q. Mr. Janjic, normally when TDEC prepares a NPDES
13 permit for which no ELG exists, you would use BPJ to establish
14 technology-based effluent limits; is that correct?

15 A. Yes.

16 Q. And normally when TDEC is issuing a permit to a
17 facility for which no ELG is applicable, you would use BPJ to
18 establish technology-based effluent limits; is that correct?

19 A. I'm sorry, maybe I was not listening carefully,
20 but that sounded like exactly the same question, and I think
21 it's yes.

22 Q. The distinction, my first question was if no ELG
23 exists. My second question is about no ELG that is
24 applicable. So let me restate that. Normally when TDEC is
25 issuing a permit to a facility for which no ELG is applicable,

1 you would use BPJ to establish technology-based effluent
2 limits?

3 A. Yes.

4 Q. And if no ELG is applicable, there are no other
5 procedures to follow in developing BAT-based effluent limits
6 except as professional judgment; is that correct?

7 A. Yes. It is referred to on a case-by-case basis,
8 yes.

9 Q. And, Mr. Janjic, in general, a BPJ analysis should
10 identify a minimum level of technology for a facility that is
11 economically achievable; is that correct?

12 A. Yes.

13 Q. And in this case for Bull Run, TDEC prepared the
14 BPJ section in the Notice of Determination, because EPA,
15 Region 4, and other commenters recommended this be done?

16 A. That's something that I can maybe clarify. In
17 Mr. Alexander's testimony, he mentioned that we had received a
18 letter from EPA in which they suggested that we might want to
19 take a look at the BAT and BPJ analysis, but they want
20 everybody to know that that letter was not in reference to the
21 Bull Run permit. It was in reference to the Kingston permit.

22 But, yes, the answer to your question is that we
23 have received comments of volume in nature so that we thought
24 that it would be responsible that we try our best to include
25 BPJ BAT analysis in the final version of the permit, although

1 we were not required to do so, since Effluent Limitation
2 Guidelines were existing and applicable.

3 Q. So you believe that TDEC was not required to
4 conduct a BPJ analysis because there's an applicable ELG for
5 this industrial category; is that correct?

6 A. There is existing and applicable Effluent
7 Limitation Guidelines for this category, yes, for coal
8 combustion products.

9 Q. And, Mr. Janjic, you believe the ELG applies to
10 all the waste streams within the facility; is that correct?

11 A. That is correct.

12 Q. And you believe the ELG applies to all of the
13 pollutants at the facility; is that correct?

14 A. Yes.

15 Q. And when TDEC prepared the permit, you thought TVA
16 provided information sufficient to characterize the existing
17 waste stream; is that correct?

18 A. That is correct.

19 Q. In the BPJ analysis for Bull Run, TDEC did not
20 consider the comparison and level of reductions of metals
21 using treatment options other than sedimentation; is that
22 correct?

23 A. That is correct.

24 Q. And TDEC did not consider the level of reduction
25 of ELGs in chemical precipitation; is that correct?

1 A. That is correct, except for what we had looked at
2 in the 2009 study that EPA provided us, and that is the most
3 information that we've had at the time for any treatment of
4 pollutants at coal combustion facilities.

5 Q. But was it your conclusion at the time that
6 because the 2009 EPA study did not select BAT, the study did
7 not provide enough information for a BPJ-based permit?

8 A. That is correct. That study mostly contained
9 information about recycle systems rather than once-through
10 systems, which is the case here.

11 Q. And TDEC did not consider the potential level of
12 reduction of metals using biological treatment; is that
13 correct?

14 A. That is correct.

15 Q. And TDEC did not consider the level of rejection
16 of metals using zero liquid discharge; is that correct?

17 A. That is correct.

18 Q. And TDEC did not analyze whether an alternative to
19 settling ponds would be affordable to the industry as a whole;
20 is that correct?

21 A. That is correct.

22 Q. And TDEC did not evaluate the cost for TVA to
23 install chemical precipitation at Bull Run; is that correct?

24 A. That is correct.

25 Q. And TDEC did not evaluate the cost for TVA to

1 install biological treatment at Bull Run; is that correct?

2 A. That's correct.

3 Q. And TDEC did not analyze whether an alternative to
4 a settling pond would be affordable to TVA; is that correct?

5 A. That's correct.

6 Q. But for metals present in both soluble and
7 particulate form, such as mercury, the settling pond will not
8 effectively remove the dissolved metals; is that correct?

9 A. That is incorrect.

10 Q. Mr. Janjic, do you recall that you testified in a
11 deposition for this case?

12 A. I have testified, and I know exactly what you're
13 going to talk about, and that is how efficient are settling
14 ponds in removing dissolved solids. And my testimony then and
15 now is that they are not particularly efficient. But your
16 previous question is, do they have any effect on dissolved
17 metals, and that is not the same question.

18 Q. My question was, for metals to have been in both
19 soluble and particulate form, such as mercury, the settling
20 ponds will not effectively remove the dissolved metals. Is
21 that correct, Mr. Janjic?

22 A. I guess that all depends on what you mean by
23 "effectively remove". There will be some removal through
24 co-precipitation and absorption, but settling ponds are not
25 deemed the most effective way for removing dissolved metals in

1 general.

2 Q. Are they minimally effective in removing dissolved
3 metals?

4 A. I'm sorry?

5 Q. Are they minimally effective at removing dissolved
6 metals?

7 A. I honestly don't know what that means, "minimally
8 effective", but they are not as effective as some other
9 treatment methods would be.

10 Q. Mr. Janjic, I'm going to have to go back to your
11 deposition. Do you recall that you were under oath at this
12 deposition?

13 A. Yes, ma'am.

14 Q. And do you recall that your attorneys were
15 present?

16 A. Yes, I do.

17 Q. And have you seen a transcript of that deposition?

18 A. Yes, I have.

19 MS. MATHENY: Your Honor, may I approach
20 the witness?

21 ADMINISTRATIVE JUDGE: Yes.

22 Q. (By Ms. Matheny) Mr. Janjic, can you please turn
23 to page 59?

24 A. I'm there.

25 Q. Can you please read lines 10 through 17?

1 A. "Do you agree with the statement that for metals
2 present in both soluble and particulate form, such
3 as mercury, the settling pond will not effectively
4 remove the dissolved fraction?"

5 "Yes."

6 "Why?"

7 "Because settling ponds are never effective in
8 removing any solid substances, including metals."

9 Q. Thank you. And when TDEC issued this permit, you
10 did not know the portion of metals that were present in
11 dissolved form; is that correct?

12 A. I honestly do not remember if we had information
13 on the ratio between total metals and dissolved metals. I
14 don't think we had that data, but I don't remember.

15 Q. It may assist you to refresh your memory to look
16 at the same page at lines 18 through 20. You don't need to
17 read them out loud, just to yourself. Did that help you
18 remember?

19 A. Well, I didn't remember then, and I don't remember
20 now.

21 Q. All right. Mr. Janjic, does this permit allow TVA
22 to continue to use the settling ponds?

23 A. Yes, it does.

24 Q. And TDEC decided to allow continued use of the
25 settling ponds at Bull Run, provided the imminence of Effluent

1 Limitation Guidelines being revised and promulgated in the
2 near future; is that correct?

3 A. I'm sorry, I didn't follow that question. Can you
4 please repeat?

5 Q. I would be happy to. In part, TDEC decided to
6 allow continued use of the settling ponds at Bull Run,
7 provided the imminence of Effluent Limitation Guidelines being
8 revised and promulgated in the near future; is that correct?

9 A. That is certainly one of the factors that we took
10 under consideration when preparing this permit.

11 Q. Mr. Janjic, you heard Mr. Hixson testify earlier,
12 I believe, that Bull Run uses once-through FGD scrubbers; is
13 that correct?

14 A. That is correct.

15 Q. And, Mr. Janjic, is it your position that if EPA
16 promulgates an ELG that is based on a recycled FGD system,
17 that ELG would not apply to Bull Run?

18 A. At this time you're asking me to speculate a
19 little bit, which is nice to see what the effluent guidelines
20 are, how they described the stream. Are those coming from the
21 same source? Yes, they're from flue gas desulfurization. Is
22 the nature of those two waste streams the same? Absolutely
23 not.

24 So that would be, certainly, for us a
25 consideration of the fundamentally different factors, as

1 described in the rules, to whether or not such Effluent
2 Limitation Guidelines can be applied for once-through
3 scrubbers. Our comments to EPA have included a request for
4 once-through systems to be included in the analysis and the
5 final Effluent Limitation Guidelines consideration.

6 Q. Mr. Janjic, my question called for a yes or no
7 answer. I just want to ask it one more time. Is it your
8 position that if EPA promulgates any ELG that is based on a
9 recycle FGD system, that ELG would not apply to Bull Run?

10 A. Well, I don't believe that I have a position right
11 now.

12 Q. Has your position changed since about a year and a
13 half ago?

14 A. I don't remember that I had a position.

15 Q. Can you please turn to page 75 of your transcript
16 and read lines 16 through 18?

17 A. Did you say 75?

18 Q. Seventy-five, yes.

19 A. And which lines again, please?

20 Q. Sixteen through eighteen, please.

21 A. "If EPA promulgates an Effluent Limitation
22 Guideline that is based under recycle FGD system,
23 would that ELG apply to Bull Run?"

24 Answer: "No, it wouldn't."

25 Q. And I just want to be clear on this, Mr. Janjic.

1 Are you saying today that your position is different from what
2 you'd said earlier?

3 A. I'm not saying that my position is different. I'm
4 saying that those two are completely different waste streams,
5 and we would have to look at the fundamentally different
6 factors to determine whether or not once that rule is
7 promulgated whether or not it would be applicable or not.

8 Q. Okay. Thank you, Mr. Janjic. It sounds like you
9 have reviewed the draft ELG. Are you aware that the draft ELG
10 does not distinguish between once-through and recycle FGD
11 scrubbers?

12 A. Yes.

13 Q. And are you aware that the draft ELG has an option
14 for continued case-by-case permitting of FGD wastewaters?

15 A. Yes.

16 Q. And is that an option that TDEC supports?

17 A. I don't know that the word "supports" is a good
18 use of the word there. What we would prefer would be that
19 EPA, in the Effluent Limitation Guidelines, describes all
20 types of waste streams, wastewater treatment processes, and
21 corresponding limitations or restrictions for those processes.

22 If EPA makes a decision that certain waste streams
23 would have to be dealt with on a case-by-case basis by state
24 agencies, then we will do so.

25 Q. Thank you, Mr. Janjic. I'm turning to the

1 question of internal monitoring and limits now. When this
2 permit was issued, you believed it was unnecessary for TDEC to
3 evaluate different wastewater treatment options for internal
4 wastewater streams, because the flue gas desulfurization
5 wastewater is part of the ELG; is that correct?

6 A. That is correct.

7 Q. And TDEC did not include an internal monitoring
8 point for FGD wastewater, in part, because your analysis
9 showed that the contribution of pollutants from the FGD waste
10 stream is not significant to the overall effluent quality; is
11 that correct?

12 A. That is correct.

13 Q. All right. Let's turn to Exhibit 69. And,
14 Mr. Janjic, this exhibit, does it reflect the result of TVA's
15 wastewater study of internal wastewater streams?

16 A. This appears to be a Bull Run Fossil wastewater
17 stream and data for dry handling conversion study. It
18 identifies in the first column different characteristics of
19 wastewater and then, in columns and the table, various
20 locations at the facility where data was collected.

21 Q. And what is the date on this document?

22 A. There is only one date that I see, which says
23 Kingston Fossil Plant dry ash conversion data collected
24 January 7, 2010.

25 Q. Mr. Janjic, I believe that may be an error. I'm

1 pointing to the date I believe is correct and applicable to
2 this case.

3 A. March 24, 2010.

4 Q. Okay. Thank you, Mr. Janjic. Now, is it your
5 understanding this is the statistics of the concentration of
6 pollutants in untreated wastewaters?

7 A. That's what it appears to be, yes.

8 Q. I'm turning to the second page of this document,
9 which is arsenic, and this is the slide I showed earlier.
10 There's one tall line here. Which wastewater stream does that
11 represent, Mr. Janjic?

12 A. FGD system, plus at gypsum stacking pipes.

13 Q. And that's for scrubber wastewater; is that
14 correct?

15 A. Yes.

16 Q. Okay. Now, Mr. Janjic, what was the concentration
17 of arsenic in this untreated FGD wastewater?

18 A. .34 milligrams per liter.

19 Q. And I'm turning to the sixth page of this
20 document, which is regarding mercury and the tall blue line
21 there. Which wastewater stream does that represent?

22 A. FGD system at gypsum stacking pipes.

23 Q. And did this show that the other wastewater
24 streams were non-detect for mercury?

25 A. It appears that they are non-detect.

1 Q. And approximately how much mercury -- what was the
2 concentration of mercury in the FGD wastewater?

3 A. It appears to be slightly over 0.0035 milligrams
4 per liter.

5 Q. I'm turning to the eighth page of this document,
6 which is for selenium. There's one tall blue line. Which
7 wastewater stream does that represent?

8 A. FGD system at gypsum stacking pipes.

9 Q. And what is the concentration of selenium listed
10 here?

11 A. 9.9 milligrams per liter.

12 Q. Okay. Thank you, Mr. Janjic. I'm going to turn
13 to the subject of performance-based effluent limits.

14 Mr. Janjic, a performance-based effluent limit would be
15 considered a type of technology-based effluent limit; is that
16 correct?

17 A. That's correct.

18 Q. And TDEC has the option to impose a
19 performance-based effluent limit on any wastewater treatment
20 facility if there's a large enough data set; is that correct?

21 A. Just the mere existence of a large data set at the
22 facility in itself does not require or mean that we have to
23 impose a performance-based limit.

24 Q. My question was whether TDEC has the option in
25 that situation.

1 A. Yes.

2 Q. So if there were a large enough data set, TDEC
3 would have the option of imposing a performance-based effluent
4 limit at the renewal of the Bull Run permit; is that correct?

5 A. That is correct.

6 Q. And is the performance-based effluent limit
7 derived from the performance characteristics of a wastewater
8 treatment system?

9 A. Yes.

10 Q. And typically TDEC would use the 95th percentile
11 of the data set for the performance-based effluent limit; is
12 that correct?

13 A. That is correct, yes.

14 Q. And, Mr. Janjic, 24 data points would be a good
15 data set; is that correct?

16 A. Yes.

17 Q. All right. Let's turn to Exhibit 21. Mr. Janjic,
18 do you recognize this exhibit?

19 A. It reminds me of a spreadsheet that we had
20 received from TVA in which they have summarized Outfall 001
21 data for a period of about two years.

22 Q. Let's go to the next page. Well, actually this
23 includes -- the column on the far left includes data on
24 arsenic; is that correct?

25 A. I'm sorry, can you say that again?

1 Q. I'm sorry. My voice is starting to -- the column
2 on the far left, that shows that arsenic is one of the metals
3 for which you are obtaining data?

4 A. Yes. I see arsenic and arsenic DRS, which is
5 dissolved.

6 Q. Is there also selenium monitoring reported?

7 A. I remember that it was. I don't see it on the
8 screen; selenium and selenium dissolved, yes.

9 Q. And at the very bottom, is there data on mercury?

10 A. Yes. There is total mercury.

11 Q. And, Mr. Janjic, if you look at the two pages
12 here, and all of the columns with data, do you now have more
13 than 24 data points?

14 A. Well, we would look at data points per parameter,
15 not a total of 24 data points for everything.

16 Q. Mr. Janjic, do you have more than 24 data points
17 for arsenic?

18 A. I guess I can count them.

19 Q. All right. Let me know when you're done with this
20 page, please.

21 A. Fifteen. I see 15 columns on this page, and I
22 believe that there is data available following. So, yes,
23 there seems to be more than 24.

24 Q. Okay. And is that true for selenium as well?

25 A. It seems it would be true for all the parameters

1 here.

2 Q. And that includes mercury as well?

3 A. It looks like it. Don't make me count.

4 Q. Okay, thank you. So, Mr. Janjic, do you have
5 enough data now to develop performance-based effluent limits
6 for arsenic, selenium, and mercury at Bull Run?

7 A. The data set is plentiful. It looks like there is
8 a lot of information that could be used for developing permit
9 limits. And if I wanted to make a case of how effective is
10 the pond in removing pollutants, thank you for helping me do
11 that. I couldn't have done a better job myself.

12 MS. MATHENY: Well, thank you, Mr. Janjic.
13 Petitioners have no further questions at this time.

14

15 **CROSS-EXAMINATION**

16 **BY MR. PARKER:**

17 Q. Mr. Janjic, I have some questions. You would want
18 24 valid data points; is that correct?

19 A. I would not use -- of course, "valid" is a good
20 word. But in regulatory terms, we would use the word maybe
21 "representative". We would like to see data points that are
22 representative of the facility's operation and wastewater
23 treatment plant effectiveness.

24 Q. And whether something is representative might be
25 because a plant is operating or not operating; is that

1 correct?

2 A. Well, that would be one of the factors. But we
3 also have to remember statements that Mr. Alexander made that
4 when you look at the data over time, we do not see a
5 significant difference in changes in concentrations as a
6 result of plant operating versus not operating and the data
7 that was submitted.

8 So we have to -- I don't know what would be
9 representative. Certainly this looks like a pretty decent
10 data set. Operation of the plant is directly proportional to
11 amount of pollutants present.

12 MR. PARKER: That's all I have.

13 MR. STAGG: TVA has no questions.

14 ADMINISTRATIVE JUDGE: Members of the
15 Board?

16 MR. HEAD: Mr. Janjic, I have five or six
17 questions here, so bear with me. My first question is, when
18 the Department prepared its permit and took into consideration
19 comments that were received from the public comment period, at
20 some point did the Department submit its draft permit to EPA
21 for review?

22 THE WITNESS: The memorandum of agreement
23 with EPA requires us to submit a final version of the permit,
24 so to speak, to EPA, if there are any substantial changes in
25 the permit that would be less restrictive than the version

1 that EPA had an opportunity to review and provide their
2 comments on. If anything, the final permit with its BMP plan
3 and additional requirements that we included in it was more
4 restrictive than the draft permit that EPA had a chance to
5 review.

6 So if I remember correctly, we did not
7 send another revised draft to EPA for additional review and
8 approval. We just provided them with the final permit.

9 MR. HEAD: When EPA provided feedback to
10 you, they approved of the permit language that you had
11 submitted, they didn't make any changes in the permit or
12 anything like that?

13 THE WITNESS: EPA did provide comments on
14 our draft Bull Run permit, but they were strictly regarding
15 316(a) variance, which is a variance that is related to
16 thermal limitations in the permit. It's a thermal variance.
17 It had nothing to do with any flue gas desulfurization,
18 Effluent Limitation Guidelines, or other limits and
19 restrictions in the permit.

20 MR. HEAD: So when the Department issued
21 the final permit, there was nothing from EPA that objected to
22 the requirements that were in the permit?

23 THE WITNESS: Well, there are two steps
24 where EPA can provide us with their comments. It is during
25 the draft comment period, which, as I said, they had no

1 comments whatsoever about who gets this authorization. And
2 then upon issuance of the final permit, EPA has a right to
3 object to terms and conditions of the permit. They haven't
4 done that or provided us any feedback regarding the final
5 issuance.

6 MR. HEAD: So to your knowledge, EPA has
7 no objection to the permit?

8 THE WITNESS: To the best of my
9 understanding, they have no objection.

10 MR. HEAD: If you will look at Exhibit 21,
11 the one that was just discussed about the different levels of
12 metals in water concentrations, there were questions about the
13 arsenic levels and the selenium levels. Hold on. I've got to
14 get closer, I apologize.

15 My first question is, from your
16 perspective, what type of levels of metals, arsenic, mercury
17 are you seeing discharged in the effluent from Outfall 001?
18 Do you know what those DMR data might be?

19 THE WITNESS: They're great. I mean,
20 these concentrations are so low that they are practically
21 lower than end of pipe water quality criteria. If this
22 effluent was going to a zero receiving stream, the limits that
23 we would have on the permit would be higher than what is being
24 discharged from the Outfall 001.

25 MR. HEAD: There's been a lot of talk

1 about best available technology for treatment here. We have
2 what I would consider to be very, very low levels of metals in
3 the effluent being discharged into the Clinch River.

4 Part of that, if you're looking at this in
5 terms of best available technology for that analysis, would be
6 evaluating cost to remove the metals further or reduce them to
7 lower level for discharge to the stream.

8 When you're talking about the level of
9 metals being less than part per billion amounts or, at the
10 most, below ten parts per billion, what would the cost be to
11 remove, as an example, mercury below five parts per billion?

12 THE WITNESS: Well, we didn't have
13 information and data from EPA or other sources that would
14 enable us to come up with the calculation, but I can give you
15 my opinion that that would be an extremely expensive thing to
16 do.

17 MR. HEAD: I'm looking at this table here.
18 And, I apologize, my eyes are not as good as they used to be.
19 I'm looking at arsenic numbers, and I see an arsenic. It says
20 DIS beside it, and then I see right above it arsenic, and
21 they're both analyzed at 228.

22 And one of the questions that you were
23 asked about this was whether there was valid data. So given
24 this information that's in this table, can you tell me whether
25 the data that's reported is -- is it a sample that's collected

1 directly from the flue gas desulfurization pipe that's coming
2 into the pond?

3 THE WITNESS: We're still on Exhibit 21;
4 right?

5 MR. HEAD: Yes.

6 THE WITNESS: This is data from the
7 effluent coming through the ash pond of Outfall 001. It
8 includes all the waste streams that are monitored, internal
9 monitoring points that exist and then subsequently treated on
10 system and discharged into the Clinch River. So this is what
11 is in the permit described as Outfall 001.

12 MR. HEAD: And when you look at this table
13 and look at the data that's represented there, I read this to
14 be parts per million. It says milligrams per liter at the
15 very top. Is that your understanding?

16 THE WITNESS: That is my understanding.
17 My first order of business tonight is to go to Target and buy
18 new reading glasses. But I would say that it is milligrams
19 per liter, except, if I can read correctly, that mercury maybe
20 is expressed in micrograms per liter.

21 MR. HEAD: Would be parts per billion?

22 THE WITNESS: Yes.

23 MR. HEAD: So when you look at the arsenic
24 levels there, we're seeing arsenic levels at -- the highest
25 level that I see is M part -- 11 parts per billion. Then when

1 I look at the mercury numbers, the numbers there are below
2 parts per billion.

3 THE WITNESS: That is correct.

4 MR. HEAD: So, again, this gets back to my
5 question about the technology and treatment there. Would you
6 consider this effluent that's being discharged into the river
7 to be very high quality effluent?

8 THE WITNESS: Yes.

9 MR. HEAD: And what conceivable advantage
10 would there be to add additional treatment to this in terms of
11 protection of fish and aquatic life?

12 THE WITNESS: I cannot imagine any
13 treatment being added or anything being done to make this
14 effluent be of better quality.

15 MR. HEAD: That's my questions. Thank
16 you.

17 THE WITNESS: Thank you.

18 MR. UNGER: I do have one question. Just
19 so I understand, Exhibit 21 is effluent data for 001 Outfall,
20 and Exhibit 59 is influent data?

21 THE WITNESS: Yes.

22 MR. UNGER: That's all.

23 ADMINISTRATIVE JUDGE: Ms. Matheny, any
24 redirect?

25 MS. MATHENY: Yes.

1 ADMINISTRATIVE JUDGE: Will it be short?

2 MS. MATHENY: It will be very short.

3 ADMINISTRATIVE JUDGE: Okay.

4

5

REDIRECT EXAMINATION

6 **BY MS. MATHENY:**

7 Q. Mr. Janjic, you're an engineer; is that correct?

8 A. Yes.

9 Q. But you're not a PE; is that correct?

10 A. I'm not a licensed engineer, no.

11 Q. And are you qualified to give an opinion about
12 wastewater treatment in this case as an expert?

13 A. I don't think I'm here as an expert witness.

14 Q. Now, Mr. Janjic, is dilution the same thing as
15 treatment?

16 A. No.

17 Q. Mr. Janjic, when the Bull Run ponds are closed and
18 the flows are decreased, will you have higher concentration of
19 FGD waste in the stilling pond?

20 A. Proportionately, the volume of FGD waste will be
21 higher.

22 Q. And is that particularly true when TVA takes its
23 bottom ash wastewater to dry handling?

24 A. Well, any removal of other waste streams from that
25 ash pond is going to result in a different proportion of the

1 flue gas desulfurization waste stream.

2 Q. And as TVA closes its ponds sequentially and the
3 flows are decreased, and the FGD wastewater concentration is
4 increased, would that violate the permit?

5 A. No.

6 MS. MATHENY: Thank you, Mr. Janjic.
7 Petitioners have no further questions at this time.

8

9

RECROSS-EXAMINATION

10 **BY MR. PARKER:**

11 Q. One quick question based upon what they just asked
12 you. Mr. Alexander testified that the flow of FGD was about
13 20 percent of the total flow of the ash pond. It's much lower
14 than that; is that correct?

15 A. Well, everybody can scribble down and figure out
16 the percentage. If we know that currently we're looking at
17 about, what, 13 million gallons, and the flue gas
18 desulfurization makes about 400,000, maybe half a million,
19 whatever that percentage is, it seems less than 20 percent to
20 me.

21 MR. PARKER: Okay. Thank you.

22 MR. HALCOMB: Sir, while you may not be an
23 expert, are you familiar with the potential adverse effects of
24 mercury on a living body; a human, for example?

25 THE WITNESS: I'm familiar with it.

1 MR. HALCOMB: Whether it's mercury or
2 selenium or some of these other metals found in the charts
3 that you were shown, are there any of those figures that you
4 believe are a threat to human health?

5 THE WITNESS: No.

6 MR. HALCOMB: Thank you.

7 MR. HEAD: Mr. Janjic, I have two
8 questions. The first one is, as I understand it, we're here
9 to hear an appeal of the permit that was issued for this
10 facility in 2000, and what was submitted to the Department for
11 evaluation was the conditions at that facility, the amount of
12 wastewater and where it came from for that particular permit
13 application; is that correct?

14 THE WITNESS: That is correct.

15 MR. HEAD: Now, in your decision-making
16 process about whether a permit should be issued, can you
17 forecast into the future and make a determination about what's
18 going to happen and how that might affect the permit limits in
19 2013 in making a decision in 2010?

20 THE WITNESS: Obviously the answer to that
21 is no. However, we try to be as professional, as responsive
22 to what we know will happen with regards to whether it's a
23 water treatment Effluent Limitation Guidelines, water quality
24 standards, not being blind to what is happening in the
25 regulatory environment.

1 MR. HEAD: So the Department made a
2 decision in 2010, based on information submitted by the
3 applicant, upon review of the comments received by the
4 different folks that submitted comments to the Department.
5 This is a similar question that I asked Mr. Alexander.

6 If conditions change at the facility, such
7 that the different waste streams are reduced significantly,
8 would the Department have, at that time, an opportunity to
9 require or ask TVA to perform a permit modification because of
10 the changes made in its operation?

11 THE WITNESS: Yes. Both the permittee has
12 an obligation to report any changes in the flow or nature of
13 the wastewater streams at the facility, and we have an
14 obligation, if necessary, to modify or revoke and reissue the
15 permit.

16 MR. HEAD: At this time has TVA notified
17 you of any intent to change the flow that's going into the
18 pond and the amount of outflow at outfall No. 001?

19 THE WITNESS: The latest information that
20 we have regarding the discharges would be in the application
21 that we have received from EPA, and we can pull up that
22 application. No substantive changes are expected in the
23 immediate future.

24 MR. HEAD: Thank you.

25 ADMINISTRATIVE JUDGE: Okay. Well, we

1 will stand in recess until nine o'clock in the morning.

2 Mr. Parker, what are the arrangements for the room over the
3 night?

4 MR. PARKER: You mean will it be locked?

5 ADMINISTRATIVE JUDGE: Is it possible? I
6 mean, I understand. But what you all might want to do with
7 your computers --

8 MR. PARKER: It'll be locked.

9 ADMINISTRATIVE JUDGE: Okay. Well, then I
10 guess everyone can make their own judgment.

11 (Whereupon, the hearing was adjourned, to
12 be reconvened at 9:00 a.m. on October 16, 2013.)
