

Cement's Toxic Legacy: FLORIDA

CONGRESSIONAL ATTACKS ON HEALTH PROTECTIONS

Cement manufacturers are dumping their pollution into Floridian communities with impunity. Lives are lost every year from this pollution, and our economy is forced to bear the burden of dollars spent on hospital visits, lost days at work, and sick Floridians who are breathing this toxic air pollution.

In August 2010, the U.S. Environmental Protection Agency at last adopted strong air pollution protections for more than 100 cement making facilities across the country, bringing pollution controls for this industry into compliance with Clean Air Act requirements that have been on the books since 1990. The protections make significant cuts in mercury, soot and other dangerous air toxics. The EPA estimates that the pollution cuts from these updates will prevent up to **2,500 premature deaths each year and yield up to \$18 billion in health benefits.**

But some members of Congress don't value saving lives and money and instead are carrying the demands of huge multinational cement companies that want to avoid cleaning up their toxic legacy. **H.J. Res. 42** would block the EPA's new requirement that these cement plants finally control their toxic air pollution with state-of-the-art pollution control technologies. A list of Florida cement kilns and their emissions of toxic mercury pollution is below.¹

Company	City	County	Kilns	Capacity (tons/yr)	Baseline Hg Emissions ² (lbs/yr)
CEMEX	Brooksville (N) ³	Hernando	2/dry	1,253,000	284
CEMEX	Brooksville (S) ⁴	Hernando	2/dry	1,418,000	173
CEMEX	Miami	Miami-Dade	1/dry	991,000	121
Suwannee American Cement	Branford	Lafayette	1/dry	800,000	98
Titan America LLC	Medley	Miami-Dade	1/dry	1,721,000	211
Florida Rock (Vulcan Materials)	Newberry ⁵	Alachua	1/dry	716,000	88

THE DANGERS OF MERCURY

Mercury poisoning is a serious threat to our health. While adults can have severe reactions to mercury poisoning – typically brought about by consumption of fish tainted with methylmercury, a highly toxic mercury compound – young children and unborn babies are especially at risk. This is why women are strongly cautioned to avoid consumption of many kinds of fish before, during, or right after pregnancy. Exposure to methylmercury while still young or in the womb can have an irreversible impact on a child's development, including birth defects, brain damage, reduced IQ, and difficulty with reading, writing, and learning.

The EPA estimates that **more than 300,000 babies are born every year with an increased risk of learning disability due to *in utero* exposure to methylmercury.**⁶ Cement plants are among the worst mercury polluters. The EPA's recently finalized health protections will reduce cement plants' mercury emissions by more than 90 percent – in addition to dramatic cuts in other pollutants that impact our health such as lead, acid gases, and soot. We urge you to defend these health protections from efforts by your colleagues to block them from ever taking effect. Florida moms are counting on it.

FISH CONSUMPTION ADVISORIES

According to the Florida Department of Health's 2011 Fish Advisories, 28 bodies of water received a DO NOT EAT advisory of at least one species of fish for all individuals. Among the bodies of water with DO NOT EAT fish advisories for women of child bearing age and young children, 6 were located in national or locally protected areas including Big Cypress Preserve (Collie County) Holeyland Wildlife and Environmental Area, Loxahatchee National Wildlife Refuge (Palm Beach County) and water bodies in the Everglades National Park including Shark River Slough, Harney and Shark Rivers, Nine Mile Pond, and Tarpon Bay and its tributaries.⁷
