***VIA CERTIFIED U.S. MAIL RETURN RECEIPT REQUESTED***

**Re: Sixty-Day Notice of Violations of the Endangered Species Act for Take of Protected Coho Salmon, Chinook Salmon, and Steelhead Trout**

Dear U.S. Tire Manufacturers:

On behalf of Institute for Fisheries Resources and Pacific Coast Federation of Fishermen's Associations, we hereby provide notice in accordance with the citizen suit provision of the Endangered Species Act ("ESA"), 16 U.S.C. § 1540(g), that you are in violation of Section 9 of ESA, 16 U.S.C. § 1538, for "take" of ESA-protected populations of coho salmon (*Oncorhynchus kisutch*), steelhead trout (*O. mykiss*), and Chinook salmon (*O. tshawytscha*). Specifically, the tires you manufacture and/or distribute contain N-(1,3-dimethylbutyl)-N'-phenyl-p-phenylenediamine ("6PPD"). 6PPD by design transforms at the surface of the tire or when released into the environment into various products, including 6PPD-quinone, or "6PPD-q."<sup>1</sup> The foreseeable discharge of 6PPD-q from your tires into waterways harms, harasses, wounds, and kills coho, Chinook, and steelhead in violation of the ESA.

6PPD-q is the second-most toxic chemical to aquatic species for which the U.S. Environmental Protection Agency has established aquatic life criteria.<sup>2</sup> Exposure to 6PPD-q can kill a coho salmon within hours, and the chemical is responsible for "urban runoff mortality syndrome," which kills up to 100% of coho returning to spawn in urban streams.<sup>3</sup> 6PPD-q from tires is also now known to be ubiquitous in our environment. It is present not only in stormwater runoff and urban watersheds at levels that can harm and kill coho salmon, steelhead trout, Chinook salmon, and other aquatic organisms, but is also now widely present in sediments and soils,<sup>4</sup> household dust,<sup>5</sup> and the urine of pregnant women,<sup>6</sup> with emerging science pointing to toxicity in mammals and therefore potential risk to human health as well.<sup>7</sup>

Many of our nation's salmon and steelhead populations have already declined dramatically to a point where they are listed under the ESA, due in part to exposure to 6PPD-q. 6PPD-q continues to harm listed salmon and steelhead, despite their listed status. If you do not

cease unauthorized take of these species within 60 days, we intend to seek redress through litigation.

## I. THE ENDANGERED SPECIES ACT

In 1973, recognizing that certain wildlife species “ha[d] been so depleted in numbers that they [we]re in danger of or threatened with extinction,” 16 U.S.C. § 1531(a)(2), Congress enacted the ESA, “to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, [and] to provide a program for the conservation of such endangered species and threatened species.” *Id.* § 1531(b). Considered “the most comprehensive legislation for the preservation of endangered species ever enacted by any nation,” the ESA embodies the “plain intent” of Congress to “halt and reverse the trend toward species extinction, whatever the cost.” *Tenn. Valley Auth. v. Hill*, 437 U.S. 153, 180, 184 (1978).

To afford a marine species such as coho salmon, Chinook salmon, and steelhead trout the protections of the ESA, the Secretary of Commerce, acting here through the National Marine Fisheries Service (“NMFS”), must first list the species as either “endangered” or “threatened” pursuant to Section 4 of the ESA. 16 U.S.C. § 1533. A species is “endangered” when it “is in danger of extinction throughout all or a significant portion of its range,” *id.* § 1532(6), while a species is “threatened” when it is “likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.” *Id.* § 1532(20); *see also id.* § 1533(c).

For species listed under the ESA, the statute contains an array of provisions designed to afford them “the highest of priorities,” so that they can recover to the point where federal protection is no longer needed. *Tenn. Valley Auth.*, 437 U.S. at 174. Of relevance here, Section 9 of the ESA prohibits “take” of endangered species. 16 U.S.C. § 1538(a)(1)(B). Exercising its authority under Section 4(d) of the ESA, *id.* § 1533(d), NMFS has promulgated regulations extending Section 9’s take prohibition to threatened coho salmon, Chinook salmon, and steelhead. 50 C.F.R. § 223.203; *see also id.* § 223.102.

The take prohibition makes it unlawful for any person to “harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect” an individual of a protected species. 16 U.S.C. § 1532(19). Congress intended to define “take” under Section 9 in the “broadest possible manner to include every conceivable way” in which a person could harm protected fish or wildlife. S. REP. NO. 93-307, at 7 (1973), *as reprinted in* 1973 U.S.C.C.A.N. 2989, 2995. As part of its 4(d) rules for threatened salmon and steelhead, NMFS specifically considers that “discharges or dumping of toxic chemicals or other pollutants (e.g., sewage, oil, gasoline) into waters or riparian areas supporting listed [entities]” may violate the Section 9 take prohibition.<sup>8</sup>

---

<sup>8</sup> Endangered and Threatened Species: Final Listing Determinations for 16 ESUs of West Coast Salmon, and Final 4(d) Protective Regulations for Threatened Salmonid ESUs, 70 Fed. Reg. 37,160 (June 28, 2005); Endangered and Threatened Species: Final Protective Regulations for Threatened Puget Sound Steelhead, 73 Fed. Reg. 55,451 (Sept. 25, 2008) (extending this take guidance to Puget Sound steelhead); Endangered and Threatened Species; Final Rule Governing Take of 14 Threatened Salmon and Steelhead Evolutionarily Significant Units (ESUs), 65 Fed.

NMFS regulations also define “harm” prohibited by Section 9 to include “an act which actually kills or injures fish or wildlife.” 50 C.F.R. § 222.102. NMFS intended for this definition of “harm” to be consistent and substantively aligned with the definition of harm promulgated for terrestrial species by the U.S. Fish and Wildlife Service (“USFWS”),<sup>9</sup> which shares responsibility with NMFS for enforcing the ESA. The U.S. Supreme Court has upheld USFWS’s regulation interpreting “harm” prohibited by Section 9 to include acts or omissions that proximately cause the death or injury of protected fish or wildlife. *Babbitt v. Sweet Home Chapter of Cmty. for a Great Ore.*, 515 U.S. 687, 697–98, 700 & n.13 (1995); *see also* Endangered and Threatened Wildlife and Plants; Final Redefinition of “Harm,” 46 Fed. Reg. 54,748, 54,750 (Nov. 4, 1981) (stating in preamble to rule defining “harm” under Section 9 that “the Service feels that ‘act’ [in the definition of ‘harm’] is inclusive of either commissions or omissions which would be prohibited by section 9”). NMFS has also explained that “[a]n action which contributes to injury can be a ‘take’ even if it is not the only cause of the injury.” Endangered and Threatened Wildlife and Plants; Definition of “Harm,” 64 Fed. Reg. 60,727, 60,728 (Nov. 8, 1999); *see also id.* (“NMFS agrees that sometimes it is difficult to isolate factors causing injury to listed species. All factors that reasonably could have caused the habitat modification or the injury itself must be carefully examined. Whenever an action alone or in combination with, or in concert with other actions is reasonably certain to injure or kill listed species, it will constitute a take.”).

Section 9 likewise makes it unlawful to “harass” protected fish or wildlife. 16 U.S.C. § 1532(19). Though NMFS has not elaborated on the meaning of “harass” in a regulation, its counterpart agency USFWS provides that, under Section 9, “harass” means “an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering.” 50 C.F.R. § 17.3.

## **II. PROTECTION OF COHO SALMON, CHINOOK SALMON, AND STEELHEAD TROUT UNDER THE ESA**

Salmon and steelhead were once abundant on the West Coast of the United States, and are a defining element of the region’s economy, with salmon alone supporting an estimated 16,000 jobs in the commercial and recreational fishing industry.<sup>10</sup>

---

Reg. 42,422 (July 10, 2000) (extending these protective regulations to 14 threatened salmon and steelhead ESUs).

<sup>9</sup> Compare 50 C.F.R. § 17.3 (FWS regulation) with 50 C.F.R. § 222.102 (NMFS regulation). The preamble to NMFS’ final Harm Rule expressly states NMFS’ intent to define “harm” in the same way that USFWS does. Endangered and Threatened Wildlife and Plants; Definition of “Harm,” 64 Fed. Reg. 60,727, 60,727 (Nov. 8, 1999) (“This final rule clarifies that NMFS’ interpretation of harm is consistent with that of FWS.”).

<sup>10</sup> Marie Fazio, *Northwest’s Salmon Population May be Running Out of Time*, N.Y. TIMES (Jan. 20, 2021), <https://www.nytimes.com/2021/01/20/climate/washington-salmon-extinction-climate-change.html>; *see also* GORDON GISLASON & EDNA LAM, ECONOMIC IMPACTS OF PACIFIC SALMON FISHERIES 27 (July 2017).

Populations of salmon and steelhead have markedly declined, however, since Euro-American contact, with an estimated 29% of nearly 1,400 historical populations of Pacific salmon and steelhead trout already lost.<sup>11</sup> Many formerly abundant populations have collapsed up and down the coast; today, approximately 2% of historic populations of wild salmon and steelhead remain.<sup>12</sup> The loss of these salmon and steelhead populations have reverberated across the economies and ecosystems of the region, causing a domino effect that affects the livelihoods of fishing men and women, including those represented by Institute for Fisheries Resources and Pacific Coast Federation of Fishermen’s Associations.

As a result of this decline, many populations of coho salmon, Chinook salmon, and steelhead are now listed as threatened or endangered under the ESA. For ESA-listing purposes, NMFA has administratively grouped steelhead and salmon populations into distinct population segments (“DPSs”) (steelhead) or “evolutionary significant units (“ESUs”) (coho salmon and Chinook salmon). These DPSs and ESUs are considered “species” under the ESA. *See* 16 U.S.C. § 1532(16) (defining “species” under the ESA as including “any distinct population segment of any species of vertebrate fish . . . which interbreeds when mature”). Today, twenty-four DPSs/ESUs of coho, Chinook, and steelhead are protected under the ESA. They are described below:

#### **A. Protected Coho Salmon Populations**

Coho salmon range from “the Soviet Far East around the Bering Sea, to Alaska, and south along the North American coast to California.”<sup>13</sup> They have dark metallic blue or greenish backs with silver sides and are commonly referred to as silver salmon. Females lay their eggs in gravel nests in freshwater streams, and newly hatched coho spend one year in freshwater streams and rivers before migrating to the ocean where they spend 1.5 years growing and feeding. They complete their lifecycle by returning to their natal streams where they spawn and die.<sup>14</sup>

Coho are considered highly adaptable as “reflected in the broad range of migration and spawning timing, the multitude of suitable freshwater habitats, the variety of foods consumed in both fresh water and salt water, and the various strategies followed in ocean rearing.”<sup>15</sup> Add to

this the fact that coho, in many cases, are able to “overcome difficult obstructions to reach areas inaccessible to other salmon.”<sup>16</sup> Despite this high adaptability, however, coho salmon populations in California are estimated to be less than 6% of their levels in the 1940s, with a 70% decline since the 1960s.<sup>17</sup>

### 1. *Central California Coast Coho ESU (Endangered)*

The Central California Coast Coho ESU “includes all naturally spawned populations of coho salmon from Punta Gorda in northern California south to and including the San Lorenzo River in central California, as well as populations in tributaries to San Francisco Bay, excluding the Sacramento-San Joaquin River system.”<sup>18</sup> Historically, population estimates of spawning Central California Coast coho salmon ESU members numbered 56,100 in the 1960s.<sup>19</sup> As of 2011, there are estimated to be fewer than 3,000 remaining.<sup>20</sup> This ESU was originally listed as threatened in 1996, and was reclassified as endangered in 2005.<sup>21</sup> NMFS’s most recent status review for the population notes a continuing long-term downward trend in

numbers.<sup>22</sup> The status review highlights that because the ESU “overlaps with the greater San Francisco Bay Area, a relatively densely populated area that has experienced steady population growth during the past several decades,” it is threatened by water pollution from urban runoff.<sup>23</sup> NMFS predicts these “urban-related impacts are likely to worsen in the future as the Bay Area population grows by a predicted 30% between the years 2010 and 2040.”<sup>24</sup>

## 2. Lower Columbia River Coho ESU (Threatened)

The Lower Columbia River Coho ESU includes “all naturally spawned populations of coho salmon in the Columbia River and its tributaries from the mouth of the Columbia up to and including the Big White Salmon and Hood Rivers, and includes the Willamette River to Willamette Falls, Oregon.”<sup>25</sup> This ESU historically consisted of a total of 24 interdependent populations, with each estimated to have historical abundances of natural-origin spawners in the thousands or tens of thousands.<sup>26</sup> The Lower Columbia River coho ESU has been in decline for the past 50 years,<sup>27</sup> and was listed under the ESA as threatened in 2005.<sup>28</sup> It has continued to decline in the past five years.<sup>29</sup> *Id.* Most populations are now believed to have 50 fish or fewer, and of the 24 populations, NMFS considers 21 “to have a very low probability of

<sup>27</sup> *Id.* at 6-6.

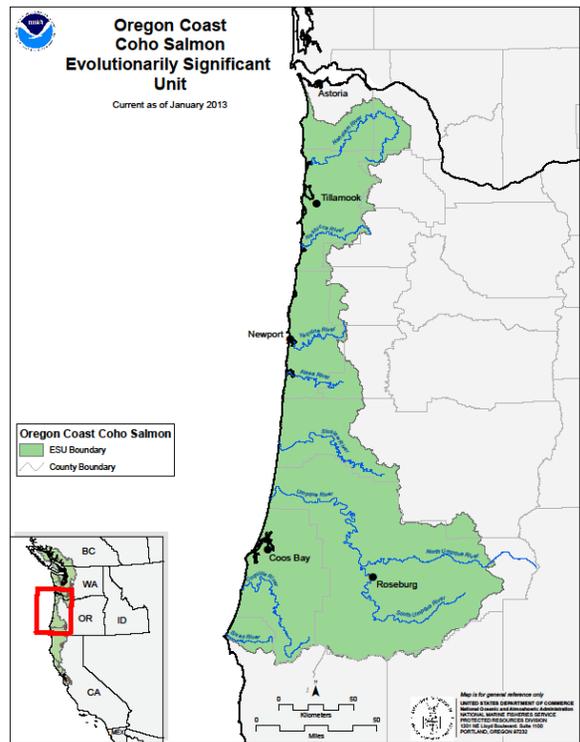

<sup>28</sup> Endangered and Threatened Species: Final Listing Determinations for 16 ESUs of West Coast Salmon, and Final 4(d) Protective Regulations for Threatened Salmonid ESUs, 70 Fed. Reg. 37,160 (June 28, 2005).

<sup>29</sup> NAT’L MARINE FISHERIES SERV., 2022 5-YEAR REVIEW: SUMMARY & EVALUATION OF LOWER COLUMBIA RIVER CHINOOK SALMON, COLUMBIA RIVER CHUM SALMON, LOWER COLUMBIA RIVER COHO SALMON, LOWER COLUMBIA RIVER STEELHEAD 32 (2022).

persisting for the next 100 years.”<sup>30</sup> NMFS specially lists “toxic contamination” as an ongoing habitat concern for the ESU,<sup>31</sup> and has explained that “managing urban stormwater . . . to reduce contaminant in streams” will be “key to protecting and improving the habitat conditions.”<sup>32</sup> At the same time, NMFS expects human population growth to increase in the region, predicting that increased urbanization will “increase the amount of impervious surfaces (pavement, roofs etc.) in watersheds” thus “increasing surface runoff during storm events.”<sup>33</sup>

### 3. *Oregon Coast Coho ESU (Threatened)*

The Oregon Coast Coho includes “[n]aturally spawned coho salmon originating from coastal rivers south of the Columbia River and north of Cape Blanco” as well as coho salmon from the Cow Creek Hatchery Program.<sup>34</sup> State and federal scientists estimate that one to two million adult coho salmon returned each year during the 1800s and early 1900s.<sup>35</sup> In recent years, however, returning coho salmon have numbered fewer than 100,000, and

they were listed as threatened in 1998.<sup>36</sup> NMFS notes that “urban and rural-residential development has caused profound changes in storm water runoff” which has decreased habitat quality and availability for Oregon Coast coho.<sup>37</sup>

#### 4. *Southern Oregon/Northern California Coho ESU (Threatened)*

The Southern Oregon/Northern California Coho ESU “includes all naturally spawned populations of coho salmon in coastal streams between Cape Blanco, Oregon and Punta Gorda, California, as well as coho salmon produced by three artificial propagation programs: Cole Rivers Hatchery, Trinity River Hatchery, and Iron Gate Hatchery.”<sup>38</sup> Historically, estimates for spawning coho salmon numbered in the hundreds of thousands in Northern California and Southern Oregon streams and rivers.<sup>39</sup> The Rogue River alone saw up to 114,000 spawning adults in the 1800s, “even after heavy fishing pressure had occurred for years.”<sup>40</sup> This number dropped to less than 5,000 by 1980.<sup>41</sup> The Southern Oregon/Northern California coho ESU was listed under the ESA as threatened in 1997,<sup>42</sup> and “[t]he status of the species has continued to worsen since listing, despite fishing prohibitions and habitat improvements.”<sup>43</sup> The current extinction risk for this population is predicted to be high in most

rivers in this ESU,<sup>44</sup> and NMFS has identified roads and urban/industrial/residential development as significant threats, stating that “[t]hese threats have led to significant stresses on coho salmon populations throughout the ESU. . . and have contributed to the decline of the species.”<sup>45</sup>

## **B. Protected Chinook Salmon Populations**

Chinook salmon range from “northern Hokkaido to the Anadyr River on the Asian coast and from central California to Kotzebue Sound, Alaska, on the North American coast.”<sup>46</sup> They are the largest Pacific salmon and are often referred to as “king salmon.” They also earned the nickname “blackmouth” from the black pigment along their gumline. Females lay their eggs in gravel nests in freshwater streams, and newly hatched Chinook spend several months in freshwater streams and rivers before migrating to the ocean where they spend 1-6 years growing and feeding. They complete their lifecycle by returning to their natal streams where they spawn and die.<sup>47</sup>

Chinook salmon possess significant variability between populations, proving they are intrinsically malleable with “the capability to adapt quickly to new opportunities.”<sup>48</sup> This adaptability is an evolutionary strategy that has enabled Chinook to “persist in the face of continued heavy fishing pressure and, in some systems, significant habitat modification.”<sup>49</sup> Despite this adaptability, however, nine populations are currently listed under the ESA as endangered or threatened, and in 2023, California Chinook salmon populations fell to their lowest level in years.<sup>50</sup>

## 1. Central Valley Spring-run Chinook ESU (Threatened)

The Central Valley Spring-Run Chinook ESU is composed of the San Joaquin River Basin and “the Sacramento River Basin downstream of impassible barriers.”<sup>51</sup> The rivers in the Central Valley were once “renowned for their production of large numbers of Pacific salmon,” with Chinook representing the most abundant salmon species in the area.<sup>52</sup> In 1880, the total commercial catch of Chinook was 11 million pounds.<sup>53</sup> The Chinook population has since declined dramatically, leading NMFS to propose listing the spring-run population under the ESA as endangered in March of 1998. By that time, the native spring-run Chinook had been extirpated from all tributaries in the San Joaquin River Basin, “which represented a large portion of the historic range and abundance of the ESU,” and the only streams with remaining fish in the Central Valley contained relatively small populations in sharp decline.<sup>54</sup> NMFS ultimately decided to list the ESU as threatened in September of 1998.<sup>55</sup> Though Chinook populations for this ESU have shown a small increase during recent years, they are still well under historic levels, falling under 25,000 for all Central Valley tributaries during the spring-run.<sup>56</sup> Due to the urbanization of the Sacramento area, NMFS

has identified stormwater runoff as a significant threat to the ESU,<sup>57</sup> stating that it is “consistently toxic to fish.”<sup>58</sup>

## 2. California Coast Chinook ESU (Threatened)

The California Coastal Chinook ESU “includes all naturally spawned populations of Chinook salmon from rivers and streams south of the Klamath River (Humboldt County, CA) to the Russian River (Sonoma County, CA).”<sup>59</sup> Populations in this ESU show marked declines from historical levels. Extrapolated data suggests that historic runs in the Eel River Watershed alone “could have ranged between 100,000 and 800,000 fish per year.”<sup>60</sup> This abundant population declined rapidly, causing the closure of the commercial fishery and cannery operations in the watershed by 1926. By the 1960s the population “had declined substantially,” with some years reporting far less than 10,000 fish returning to the watershed.<sup>61</sup> Despite being listed under the ESA as threatened in 1999,<sup>62</sup> current data “provide[s] no indication that any of the independent populations (likely to persist in isolation) are approaching viability targets.”<sup>63</sup> NMFS identified stormwater runoff as a significant threat to the ESU.<sup>64</sup>

<sup>57</sup> NAT'L MARINE FISHERIES SERV., RECOVERY PLAN FOR THE EVOLUTIONARILY SIGNIFICANT UNITS OF SACRAMENTO RIVER WINTER-RUN CHINOOK SALMON AND CENTRAL VALLEY SPRING-RUN CHINOOK SALMON AND THE DISTINCT POPULATION SEGMENT OF CALIFORNIA CENTRAL VALLEY STEELHEAD App. A at 20 (2014).

<sup>64</sup> *Id.* at 17–18.

### 3. Lower Columbia River Chinook ESU (Threatened)

The Lower Columbia River Chinook ESU includes Chinook from 17 artificial propagation programs as well as “[a]ll naturally spawned populations of Chinook salmon from the Columbia River and its tributaries from the river’s mouth at the Pacific Ocean upstream to and including the Hood River in Oregon and the White Salmon River in Washington, including the Willamette River to Willamette Falls, Oregon, but excluding spring-run Chinook salmon in the Clackamas River.”<sup>65</sup> More than 295,000 Chinook once navigated the Lower Columbia River and its tributaries.<sup>66</sup> These numbers dropped dramatically, leading to the ESU’s threatened listing under the ESA in 1999.<sup>67</sup> Of the 32 populations comprising this ESU, only two are considered viable, while “[m]ost populations (26 out of 32) have a very low probability of persistence over the next 100 years (and some are extirpated[]).”<sup>68</sup> The ESU has experienced over 95% population loss, with fewer than 14,000 Chinook now traversing its rivers and streams.<sup>69</sup> Toxic contamination of water from stormwater runoff and nonpoint source pollution is a key factor contributing to the ESU’s low numbers.<sup>70</sup> Considering the region’s population of 5 million people is expected to grow exponentially to between 40 million and 100 million by the end of the century, toxin infiltration of waterways will result in increasingly devastating effects.<sup>71</sup>

#### 4. Snake River Spring/Summer-run Chinook ESU (Threatened)

The Snake River Spring/Summer-run Chinook ESU “includes all naturally spawned spring/summer Chinook salmon originating from the mainstem Snake River and the Tucannon River, Grande Ronde River, Imnaha River, and Salmon River subbasins.”<sup>72</sup> This ESU was once “revered by Native Americans and local communities and prized by fisheries” for its impressive runs. The runs began to decline in the late 1800s and continued to deteriorate throughout the 1900s, leading many populations in the ESU to become extinct.<sup>73</sup> NMFS listed the Snake River Spring/Summer-run ESU under the ESA as threatened in 1992.<sup>74</sup> However, the future of the ESU remains perilous, with sharp population declines noted within the last five years.<sup>75</sup> Toxic pollutant runoff from urban sources is a contributing factor to this diminishing population.<sup>76</sup> Runoff is especially problematic in streams experiencing water withdrawals, where low flows result in high concentrations of pollutants.<sup>77</sup> With low flows a primary limiting factor for most tributaries in this ESU, the impact of continued toxic runoff could prove devastating on this acutely declining population.<sup>78</sup>

<sup>72</sup> NAT’L MARINE FISHERIES SERV., ESA RECOVERY PLAN FOR SNAKE RIVER SPRING/SUMMER CHINOOK SALMON (*ONCORHYNCHUS TSHAWYTSCHA*) & SNAKE RIVER BASIN STEELHEAD (*ONCORHYNCHUS MYKISS*) 27 (2017).

<sup>78</sup> *See id.* at 134–35 (NAT’L MARINE FISHERIES SERV., 2022 5-YEAR REVIEW: SUMMARY & EVALUATION OF SNAKE RIVER SPRING/SUMMER CHINOOK SALMON 31 (2022)).

## 5. Snake River Fall-run Chinook ESU (Threatened)

The Snake River Fall-run Chinook ESU contains Chinook salmon from four artificial propagation programs as well as “all natural-origin fall Chinook salmon originating from the lower Snake River below Hells Canyon Dam and from the Tucannon River, Grande Ronde River, Imnaha River, Salmon River, and Clearwater River subbasins.”<sup>79</sup> Over half a million Chinook once traveled through the Snake River basin each fall. These numbers began to drop precipitously in the late 1800s. By the 1980s the ESU was seeing an average of only 100 adults each year.<sup>80</sup> This catastrophic decline led NMFS to list the ESU under the ESA as threatened in 1992.<sup>81</sup> The population increased following the ESA listing, reaching 20,000 spawning adults in 2013.<sup>82</sup> Unfortunately, this increase did not last and the population has since declined.<sup>83</sup> NMFS identified urban runoff as a primary threat to this ESU.<sup>84</sup>

<sup>79</sup> NAT'L MARINE FISHERIES SERV., ESA RECOVERY PLAN FOR SNAKE RIVER FALL CHINOOK SALMON (*ONCORHYNCHUS TSHAWYTSCHA*) 48 (2017).

## 6. Sacramento River Winter-run Chinook ESU (Endangered)

The Sacramento River Winter-run Chinook ESU “includes winter-run Chinook salmon spawning naturally in the Sacramento River and its tributaries, as well as winter-run Chinook salmon that are part of the conservation hatchery program at the Livingston Stone National Fish Hatchery.”<sup>85</sup> This ESU contained nearly 100,000 salmon in the 1960s. This number plummeted to fewer than 200 in the 1990s.<sup>86</sup> NMF original listed the ESU under the ESA as threatened in 1989 under emergency provisions, but reclassified the population as endangered in 1992.<sup>87</sup> Stormwater runoff laced with toxins is one of the many threats impacting the waterways comprising this ESU. The San Francisco Bay/Sacramento-San Joaquin Delta area receives between 5,000 to 40,000 tons of contaminants annually from point- and non-point sources, including urban stormwater runoff.<sup>88</sup> NMFS indicates that input rates of toxic pollution are on the rise.<sup>89</sup>

<sup>89</sup> *Id.* app. B at 2-24 (2014).

## 7. *Puget Sound Chinook ESU (Threatened)*

The Puget Sound Chinook ESU is bordered by “the Nooksack River in the North to southern Puget Sound, includes Hood Canal, and extends westerly out of the Strait of Juan de Fuca to the Elwha River.”<sup>90</sup> It includes both naturally spawning and hatchery Chinook salmon. It is estimated that 670,000 Chinook were harvested from the ESU in 1908.<sup>91</sup> The ESU was listed under the ESA as threatened in 1999.<sup>92</sup> Despite listing, most populations continue to decline.<sup>93</sup> Stormwater runoff containing toxic contaminants is a growing concern as the human population in this area is fast-growing.<sup>94</sup>

<sup>94</sup> *Id.* at 22.

## 9. Upper Columbia River Spring-run Chinook ESU (Endangered)

The Upper Columbia River Spring-run Chinook ESU includes both naturally spawned and artificially propagated salmon in “the Columbia River and its tributaries between Rock Island Dam and Chief Joseph Dam.”<sup>100</sup> Historically, it is estimated that 588,000 Chinook comprised this ESU.<sup>101</sup> Resource extraction beginning in the 1860s depleted the population leading to its endangered listing under the ESA in 1999.<sup>102</sup> Despite listing, the population continues to deteriorate. The most recent status review states that the population has declined by 48% within the previous five years.<sup>103</sup> Emerging contaminants caused by urban development are of increasing concern.<sup>104</sup> With human population increases predicted for the area, toxic contaminants infiltrating the water will also increase.<sup>105</sup>

### C. Protected Steelhead Trout Populations

Historically, steelhead trout ranged from the Bristol Bay area in Alaska to Baja California, but their range is shrinking and currently extends from Cold Bay on the Alaska Peninsula to central California.<sup>106</sup> Steelhead trout are the ocean-going form of the species *Oncorhynchus mykiss*. Juveniles rear in freshwater before migrating to the ocean to mature. They return as adults to their natal freshwater streams to spawn. Unlike salmon, steelhead can spawn multiple times in their lifespan.<sup>107</sup> *Oncorhynchus mykiss* that remain in freshwater are called rainbow trout.<sup>108</sup>

Steelhead trout can jump 11 feet in the air when climbing waterfalls and can accelerate from zero to 25 miles per hour in one second.<sup>109</sup> They have shifted their migration timing to coincide with cooler temperatures in an ever-warming world, and they “excel at colonizing newly created habitat and adapting locally to complicated dynamics.”<sup>110</sup> Despite their amazing capabilities and adaptability, 11 of the 14 steelhead populations on the West Coast are listed under the ESA as endangered or threatened, and a lack of historical baseline data for steelhead populations, especially those not listed, means that current estimates likely “underestimate the loss of population diversity and abundance.”<sup>111</sup>

## 2. *South-Central California Coast Steelhead DPS (Threatened)*

The South-Central California Coast Steelhead DPS “includes all naturally spawned populations of steelhead in streams from the Pajaro River (inclusive) to, but not including the Santa Maria River, California.”<sup>119</sup> The South-Central California Coast Steelhead DPS has declined dramatically from an estimated 25,000 returning adults historically, to fewer than 500 returning adults today.<sup>120</sup> It was listed as threatened under the ESA in 1997.<sup>121</sup> The South-Central California Coast Steelhead DPS has declined in part due to urbanization that has “resulted in the loss, degradation, simplification, and fragmentation of habitat,”<sup>122</sup> and the “Recovery Planning Area is characterized by severe to very severe degradation of habitat conditions along the lower mainstem river channels where urban and agricultural development is concentrated[.]”<sup>123</sup>

<sup>119</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 848 (Jan. 5, 2006).

### 3. California Central Valley Steelhead DPS (Threatened)

The California Central Valley Steelhead DPS “includes all naturally spawned populations of steelhead in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco and San Pablo Bays and their tributaries.”<sup>124</sup> Steelhead were once “common in Central Valley tributaries,” and may have approached “one to two million adults annually” but have “declined dramatically since European settlement of the Central Valley in the mid-1800s.”<sup>125</sup> The California Central Valley Steelhead DPS was listed as threatened under the ESA in 1998.<sup>126</sup> Habitat quantity and quality have continued to decline, in part due to urbanization.<sup>127</sup> In particular, NMFS notes that toxic urban stormwater runoff in the Sacramento River poses a threat to the DPS.<sup>128</sup>

<sup>124</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 849 (Jan. 5, 2006).

<sup>126</sup> Endangered and Threatened Species: Threatened Status for Two ESUs of Steelhead in Washington, Oregon, and California, 63 Fed. Reg. 13,347 (Mar. 19, 1998).

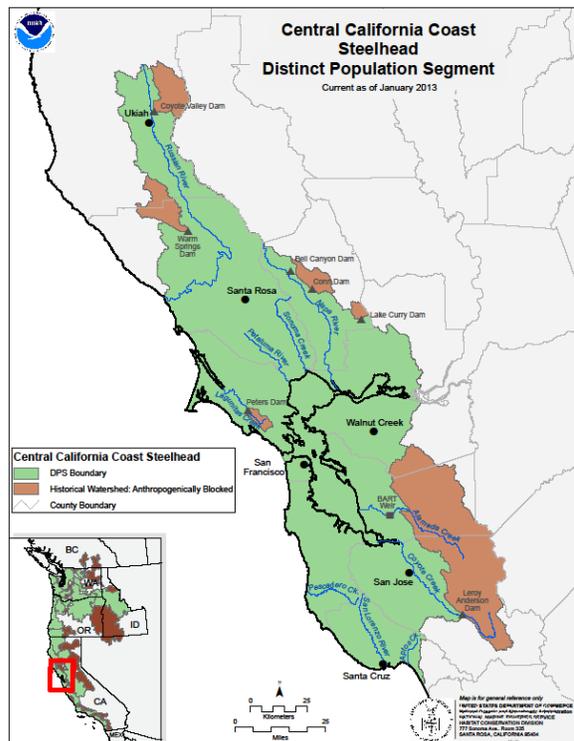

<sup>127</sup> NAT’L MARINE FISHERIES SERV., RECOVERY PLAN FOR THE EVOLUTIONARILY SIGNIFICANT UNITS OF SACRAMENTO RIVER WINTER-RUN CHINOOK SALMON AND CENTRAL VALLEY SPRING-RUN CHINOOK SALMON AND THE DISTINCT POPULATION SEGMENT OF CALIFORNIA CENTRAL VALLEY STEELHEAD, at i-ii, 4-14 (2014).

<sup>128</sup> *Id.* at 4-22.

#### 4. Central California Coast Steelhead DPS (Threatened)

The Central California Coast Steelhead DPS includes “all naturally spawned populations of steelhead in coastal streams from the Russian River (inclusive) to Aptos Creek (inclusive), and the drainages of San Francisco, San Pablo, and Suisun Bays eastward to Chipps Island at the confluence of the Sacramento and San Joaquin Rivers; and tributary streams to Suisun Marsh including Suisun Creek, Green Valley Creek, and an unnamed tributary to Cordelia Slough (commonly referred to as a Red Top Creek), exclusive of the Sacramento-San Joaquin River Basin of the California Central Valley.”<sup>129</sup>

Historically, a total of 94,000 adult steelhead spawned in the rivers and streams of the Central California Coast Steelhead DPS.<sup>130</sup> Low survival of juveniles in freshwater has contributed to precipitous declines of steelhead throughout the central California coast,<sup>131</sup> and they were listed under the ESA as threatened in 2006.<sup>132</sup> The most impacted populations over the last 70 years are those surrounding San Francisco Bay, with NMFS recognizing that their habitat has been degraded by construction of roads and urban development.<sup>133</sup> NMFS predicts this DPS “may not be viable in the long term.”<sup>134</sup>

<sup>129</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 849 (Jan. 5, 2006).

<sup>134</sup> *Id.* at 37.

## 5. Northern California Steelhead DPS (Threatened)

The Northern California Steelhead DPS includes “all naturally spawned populations of steelhead in California coastal river basins from Redwood Creek southward to, but not including, the Russian River.”<sup>135</sup> Prior to the 1960s, approximately 198,000 adult steelhead migrated upstream to spawn in the major rivers of the Northern California Steelhead DPS. Currently, population abundance is very low relative to historical estimates, with recent trends downward in most populations.<sup>136</sup> The DPS was listed under the ESA as threatened in 2006.<sup>137</sup> NMFS describes the high road density throughout the watershed as a “High threat to adult, egg, and winter rearing juveniles, and a Very High threat to summer rearing juveniles” because it accelerates both “sediment delivery” and “storm runoff” to riparian and aquatic habitat.<sup>138</sup>

<sup>135</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 849 (Jan. 5, 2006).

<sup>138</sup> III NAT’L MARINE FISHERIES SERV., FINAL COASTAL MULTISPECIES RECOVERY PLAN: NORTHERN CALIFORNIA STEELHEAD 116 (2016).

## 6. Lower Columbia Steelhead DPS (Threatened)

The Lower Columbia Steelhead DPS “includes all naturally spawned populations of steelhead in streams and tributaries to the Columbia River between the Cowlitz and Wind Rivers, Washington (inclusive), and the Willamette and Hood Rivers, Oregon (inclusive). Excluded are steelhead in the upper Willamette River Basin above Willamette Falls and steelhead from the Little and Big White Salmon Rivers in Washington.”<sup>139</sup> “Historically, the Lower Columbia River steelhead DPS consisted of 23 independent populations: 17 winter-run populations and six summer-run populations.”<sup>140</sup> The Lower Columbia Steelhead DPS was listed under the ESA as threatened in 1998,<sup>141</sup> and “[t]oday, 16 of the 23 Lower Columbia River steelhead populations have a low or very low probability of persisting over the next 100 years, and six populations have a moderate probability of persistence.”<sup>142</sup> Reduced habitat quality limits the viability of steelhead in the Columbia River estuary, with NMFS noting that “system-wide” habitat is affected by “degraded water quality”<sup>143</sup> and “[t]oxic contaminants are widespread in the estuary, both geographically and in the food chain.”<sup>144</sup> NMFS notes that so far, “[t]he Clean Water Act has not been sufficient to prevent pollution of the Lower Columbia River. Toxic contamination through the production, use, and disposal of numerous chemicals from multiple sources including industrial, agricultural, medical and pharmaceutical, and common household uses enter the Columbia River in wastewater

<sup>139</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 849 (Jan. 5, 2006).

<sup>144</sup> NAT'L MARINE FISHERIES SERV., ESA RECOVERY PLAN FOR LOWER COLUMBIA RIVER COHO SALMON, LOWER COLUMBIA RIVER CHINOOK SALMON, COLUMBIA RIVER CHUM SALMON, AND LOWER COLUMBIA RIVER STEELHEAD 4-10–4-11 (2013).

treatment plant effluent, stormwater runoff, and nonpoint source pollution remains a growing concern.”<sup>145</sup>

## 7. Middle Columbia River Steelhead DPS (Threatened)

The Middle Columbia River Steelhead DPS “includes all naturally spawned populations of steelhead in streams from above the Wind River, Washington, and the Hood River, Oregon (exclusive), upstream to, and including, the Yakima River, Washington, excluding steelhead from the Snake River Basin.”<sup>146</sup> It was listed under the ESA as threatened in 1999.<sup>147</sup> Historically, there were 20 populations within the Middle Columbia River DPS, but three have already been extirpated.<sup>148</sup> The majority of the remaining populations “are rated at moderate risk,” with three of the populations “at high risk of extinction within 100 years.”<sup>149</sup> NMFS notes that “in general tributary habitat conditions are still degraded through past and present anthropogenic activities (levees, water withdrawals, roads, dams, etc.). These degraded habitat conditions continue to negatively affect Middle Columbia River steelhead abundance, productivity, spatial structure, and diversity. In addition, ongoing development and land-use activities may also have negative effects into the foreseeable future.”<sup>150</sup>

## 8. Puget Sound Steelhead DPS (Threatened)

The Puget Sound Steelhead DPS “includes all naturally spawned steelhead originating below natural and manmade impassable barriers in rivers flowing into Puget Sound from the Elwha River (inclusive) eastward, including rivers in Hood Canal, South Sound, North Sound, and the Strait of Georgia.”<sup>151</sup> Historical abundance is unknown, but “commercial catch records and news articles indicated that 409,000 to 930,000 adult steelhead returned each year to Puget Sound at the end of the 19<sup>th</sup> Century.”<sup>152</sup> This DPS was listed under the ESA as a threatened species in 2007,<sup>153</sup> and today the current abundance of Puget Sound Steelhead is estimated at less than 22,000 recruits/spawners.<sup>154</sup> NMFS notes that “[t]he loss of steelhead habitat in many areas of Puget Sound has been staggering, especially in those areas that have undergone extensive urban and residential development,”<sup>155</sup> and that “[u]rbanization and resulting increases in impervious surfaces also increase storm-water runoff during fall and winter months,” which has “pollute[d] water quality, and contaminate[d] local aquatic systems.”<sup>156</sup>

## 9. Snake River Basin Steelhead DPS (Threatened)

The Snake River Basin Steelhead DPS “includes all naturally spawned populations of steelhead in streams in the Snake River Basin of southeast Washington, northeast Oregon, and Idaho.”<sup>157</sup> Historically, the Snake River is believed to have been the Columbia River basin’s most productive drainage for steelhead, supporting 55 percent of summer steelhead.<sup>158</sup> “Previous accounts estimated annual adult returns of 40,000 to 60,000 steelhead above Lewiston Dam on the lower Clearwater River in the early 1960s, 15,000 and 4,000 steelhead to the Grande Ronde and Imnaha Rivers in the 1960s, and 3,000 steelhead to the Tucannon River in the mid-1950s. The Snake River steelhead run at Ice Harbor Dam in 1962 included 108,000 adults, and the run averaged approximately 70,000 adults annually until 1970.”<sup>159</sup> Widespread habitat blockage from hydropower systems, habitat degradation, and flow impairment all led to a sharp decline in natural-origin returning steelhead,<sup>160</sup> and the population was listed under the ESA as threatened in 1997.<sup>161</sup> NMFS recognizes that impaired water quality, including toxic pollutant contamination, limits the viability of Snake River steelhead.<sup>162</sup>

<sup>157</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 849 (Jan. 5, 2006).

## 10. Upper Columbia River Steelhead DPS (Threatened)

The Upper Columbia River Steelhead DPS “includes all naturally spawned populations of steelhead in streams in the Columbia River Basin upstream from the Yakima River, Washington, to the U.S.-Canada border.”<sup>163</sup> It was listed under the ESA as threatened in 2009,<sup>164</sup> and today none of the extant populations of Upper Columbia River Steelhead NMFS deems necessary for the species’ recovery are viable, with all having a moderate to high risk of extinction.<sup>165</sup> NMFS notes that the habitat in the Columbia River estuary is degraded “as a result of past and current releases of toxic contaminants,” including from urban stormwater runoff.<sup>166</sup>

<sup>163</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 849 (Jan. 5, 2006).

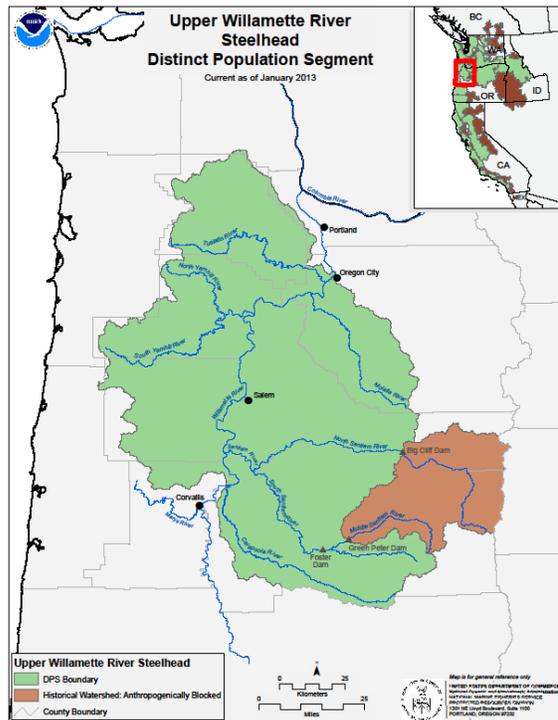

<sup>164</sup> Listing Endangered and Threatened Species: Change in Status for the Upper Columbia River Steelhead Distinct Population Segment, 74 Fed. Reg. 42,605 (Aug. 24, 2009).

<sup>165</sup> NAT’L MARINE FISHERIES SERV’, UPPER COLUMBIA SPRING CHINOOK SALMON AND STEELHEAD RECOVERY PLAN, at xxi (2007).

<sup>166</sup> *Id.* at 3-15.

## 11. Upper Willamette River Steelhead DPS (Threatened)

The Upper Willamette River Steelhead DPS “includes all naturally spawned populations of winter-run steelhead in the Willamette River, Oregon, and its tributaries upstream from Willamette Falls to the Calapooia River (inclusive).”<sup>167</sup> Historical abundance is not well documented, but steelhead are currently depressed relative to historic levels,<sup>168</sup> and the Upper Willamette River Steelhead DPS was listed under the ESA as threatened in 1999.<sup>169</sup> NMFS recognizes that “[u]rban and rural-residential development in the lower subbasins and the mainstem Willamette River floodplain has led to the degradation of riparian and floodplain conditions, as well as an alteration of the natural drainage network due to roads, ditches and impervious surfaces” within the habitat of the Upper Willamette River Steelhead DPS, and that these activities reduce water quality in the principle subbasins and mainstem Willamette River and “inhibit the amount and quality of spawning and rearing habitats.”<sup>170</sup>

### III. INCLUSION OF 6PPD IN TIRES CAUSES TAKE OF PROTECTED COHO SALMON, CHINOOK SALMON, AND STEELHEAD TROUT

As discussed above, toxic water contamination from stormwater represents a significant source of ongoing harm and a threat to the continued existence of these ESA-listed salmon and trout populations. Abundant scientific evidence now makes clear that your inclusion of 6PPD in tires that you manufacture and/or distribute is a leading cause of such toxic contamination. Your inclusion of 6PPD in tires therefore causes “take” of the above listed species of coho salmon, Chinook salmon, and steelhead trout, in violation of Section 9 of the ESA, 16 U.S.C. § 1538(a)(1)(B); 50 C.F.R. § 223.203.

<sup>167</sup> Endangered and Threatened Species: Final Listing Determinations for 10 Distinct Population Segments of West Coast Steelhead, 71 Fed. Reg. 834, 849 (Jan. 5, 2006).

<sup>168</sup> OR. DEP’T OF FISH & WILDLIFE AND NAT’L MARINE FISHERIES SERV., UPPER WILLAMETTE RIVER CONSERVATION AND RECOVERY PLAN FOR CHINOOK SALMON AND STEELHEAD 4-5 (2011).

<sup>169</sup> Endangered and Threatened Species: Threatened Status for Two ESUs of Steelhead in Washington and Oregon, 64 Fed. Reg. 14,517 (Mar. 25, 1999).

<sup>170</sup> OR. DEP’T OF FISH & WILDLIFE AND NAT’L MARINE FISHERIES SERV., UPPER WILLAMETTE RIVER CONSERVATION AND RECOVERY PLAN FOR CHINOOK SALMON AND STEELHEAD 5-11 (2011).

6PPD is used in most if not all tires, and it is designed to react with ground-level ozone to increase tire lifespan.<sup>171</sup> 6PPD contained in tires migrates over the life of the tire to the tire surface to supply a continual source and discharge of 6PPD pollutants, with the amount of 6PPD in the tire decreasing over time.<sup>172</sup> When 6PPD reacts with ozone, it creates 6PPD-q.<sup>173</sup> This 6PPD-q is then deposited on roadways and other impervious surfaces such as parking surfaces, where it is discharged during storm events into the aquatic habitats of the species discussed above.<sup>174</sup>

6PPD-q is acutely toxic to coho salmon, Chinook salmon, and steelhead trout.<sup>175</sup> When exposed to 6PPD-q, all three species demonstrate a characteristic pattern of symptomatic behavior, including “circling, surface gapping, and equilibrium loss,” followed by death.<sup>176</sup>

For coho salmon, the lethal concentration of 6PPD-q required to kill 50% of test animals (“LC<sub>50</sub>”) is estimated to be between 41 to 95 nanograms per liter (“ng/L”) (or .041–.095

TOXICOL. CHEM. 815 (2023).

<sup>176</sup> Zhenyu Tian et al., *A Ubiquitous Tire Rubber-Derived Chemical Induces Acute Mortality in Coho Salmon*, 371 SCIENCE 185, 185 (2021); Markus Brinkmann et al., *Acute Toxicity of the Tire Rubber-Derived Chemical 6PPD-quinone to Four Fishes of Commercial, Cultural, and Ecological Importance*, 9 ENVTL. SCI. & TECH. LETTERS 333, 336 (2022); Bonnie P. Lo et al., *Acute Toxicity of 6PPD-quinone to Early Life Stage Juvenile Chinook (*Oncorhynchus tshawytscha*) and Coho (*Oncorhynchus kisutch*) Salmon*, 42 ENVTL. TOXICOLOGY & CHEMISTRY 815, 815 (2023).

micrograms per liter (“µg/L”).<sup>177</sup> This toxicity level suggests that 6PPD-q “is among the most toxic chemicals known for aquatic organisms, at least to coho salmon.”<sup>178</sup> In one experiment where juvenile coho salmon were exposed for 24 hours to untreated urban runoff, the fish “began dying soon during exposure (2–4 [hours]), with near-maximal cumulative mortality within 8 [hours].”<sup>179</sup> Even when this urban runoff was diluted 95% with clean water, exposure to the diluted stormwater was generally lethal to coho.<sup>180</sup> And even when coho were transferred to clean water after exposure to 6PPD-q, they did not recover.<sup>181</sup>

6PPD-q is also acutely toxic to rainbow and steelhead trout. The LC<sub>50</sub> for rainbow trout (the freshwater resident strain of ocean-going steelhead) exposed to 6PPD-q is estimated to be 1.00 µg/L after 72–96 hours.<sup>182</sup> Scientists believe the life history differences between rainbow trout and steelhead trout “(i.e., freshwater residence vs ocean migration) is not a determinant of susceptibility [to 6PPD-q],”<sup>183</sup> meaning steelhead trout are likely to experience similar levels of mortality. When exposed to untreated stormwater runoff from three different storms, steelhead trout experienced 4%–42% mortality and generally died within 1–2 days of exposure.<sup>184</sup>

Finally, Chinook salmon are also vulnerable to 6PPD-q exposure. The LC<sub>50</sub> value has not been precisely determined, but the LC<sub>25</sub> estimate for juvenile Chinook salmon exposed to 6PPD-q is 43,699 ng/L (43.699 µg/L).<sup>185</sup> When exposed to untreated stormwater runoff from three different storms, Chinook salmon suffered up to 13% mortality, and generally died within 1–2

days of exposure.<sup>186</sup> There are also likely sublethal effects for Chinook salmon from exposure to 6PPD-q.<sup>187</sup>

6PPD-q is “ubiquitous” in urban runoff and surface waters,<sup>188</sup> and has been repeatedly found in concentrations above the levels known to kill coho and steelhead trout.<sup>189</sup> For instance, 6PPD-q was detected in Los Angeles region roadway runoff at 4.1 to 6.1 µg/L; in San Francisco region creeks at 1.0 to 3.5 µg/L; and in Seattle-region watersheds from .3 to 3.2 µg/L.<sup>190</sup>

For all populations of coho salmon, steelhead trout, and Chinook salmon described above, NMFS has identified stormwater runoff into their habitat as a threat. Current stormwater practices are generally insufficient to remove 6PPD-q,<sup>191</sup> with most urban stormwater discharged

to aquatic ecosystems without treatment.<sup>192</sup> Given 6PPD-q’s ubiquity and lack of regulation and treatment, stormwater runoff containing 6PPD-q reaches and harms these ESA-protected populations and pollutes their habitat. This discharge of toxic 6PPD-q from your tires into ESA-protected coho salmon, steelhead trout, and Chinook salmon habitat harms, harasses, wounds, and kills, and therefore unlawfully “takes” individual coho, Chinook salmon, and steelhead within the meaning of Section 9 of the ESA. *See* 16 U.S.C. §§ 1538(a)(1)(B), 1532(19); 50 C.F.R. § 222.102.

The discharge of 6PPD-q from your tires also has large-scale impacts in violation of Section 9. 6PPD-q has recently been identified as the cause of “urban runoff mortality syndrome” observed for decades in coho salmon in urban waterways.<sup>193</sup> Starting in the 1980s,<sup>194</sup> researchers observed the same abnormal behaviors now known to be characteristic of 6PPD-q exposure in coho salmon returning to spawn in Puget Sound, Washington.<sup>195</sup> Surveys of returning coho salmon also revealed premature spawner mortality rates ranging from 60–100% in urban waterways, whereas the comparable rate in non-urban streams was <1%.<sup>196</sup> Researchers later confirmed that this urban runoff mortality syndrome behavior and mortality was not limited to adult coho salmon, and noted that “lower abundances of juvenile coho have been observed in urban watersheds compared to non-urban ones.”<sup>197</sup> Researchers have concluded that “[w]ild coho populations cannot withstand the high rates of mortality that are now regularly occurring in

urban spawning habitats,”<sup>198</sup> and that “it will be difficult, if not impossible to reverse historical coho declines without addressing the toxic pollution dimension of freshwater habitats.”<sup>199</sup>

In addition to large-scale harm to coho documented in Washington state, California state officials similarly believe that 6PPD-q generated from 6PPD-containing tires may have been responsible for historic declines of coho salmon in California, and may likewise jeopardize recovery of coho salmon populations in that state.<sup>200</sup> As discussed above, coho salmon populations in California are estimated to be less than 6% of their levels in the 1940s, with a 70% decline since the 1960s.<sup>201</sup> California’s Department of Toxic Substances Control (“CA DTSC”) explains that “[t]he 30-year period from the 1960s to the 1990s, during which [there was a documented] 70% decline in coho, corresponds with the use of 6PPD in tires,” and finds it “notable that during this period coho were extirpated from the San Francisco Bay Area, which arguably has the highest concentration of vehicle traffic in coho territory within California.”<sup>202</sup> CA DTSC concludes that “[t]he presence of 6PPD-quinone in California’s waterways continues to threaten the state’s remaining coho salmon populations and may jeopardize the recovery of this species.”<sup>203</sup>

#### IV. CONCLUSION

The loss of salmon and steelhead populations has already significantly diminished the commercial and recreational fisheries of the West Coast, and these depleted populations cannot withstand the continued toxic assault from 6PPD-q. The ESA authorizes citizen suits to enjoin violations of the ESA. 16 U.S.C. § 1540(g)(1)(a). As set forth above, you are in violation of Section 9 of ESA for take of ESA-protected species of coho salmon, Chinook salmon, and
