

Cement's Toxic Legacy: COLORADO

CONGRESSIONAL ATTACKS ON HEALTH PROTECTIONS

Cement manufacturers are dumping their pollution into Colorado communities with impunity. Lives are lost every year from this pollution, and our economy is forced to bear the burden of dollars spent on hospital visits, lost days at work, and sick Coloradoans who are breathing this toxic air pollution.

In August 2010, the U.S. Environmental Protection Agency at last adopted strong air pollution protections for more than 100 cement making facilities across the country, bringing pollution controls for this industry into compliance with Clean Air Act requirements that have been on the books since 1990. The protections make significant cuts in mercury, soot and other dangerous air toxics. The EPA estimates that the pollution cuts from these updates will prevent up to **2,500 premature deaths each year and yield up to \$18 billion in health benefits.**

But some members of Congress don't value saving lives and money and instead are carrying the demands of huge multinational cement companies that want to avoid cleaning up their toxic legacy. **H.J. Res. 42** would block the EPA's new requirement that these cement plants finally control their toxic air pollution with state-of-the-art pollution control technologies. A list of Colorado cement kilns and their emissions of toxic mercury pollution is below.¹

Company	City	County	Kilns	Capacity (tons/yr)	Baseline Hg Emissions ² (lbs/yr)
CEMEX	Lyons	Boulder	1/dry	474,000	115
Holcim, Inc.	Florence	Fremont	1/dry	1,542,000	25
GCC of America, Inc. ³	Pueblo	Pueblo	N/A	N/A	111

THE DANGERS OF MERCURY

Mercury poisoning is a serious threat to our health. While adults can have severe reactions to mercury poisoning – typically brought about by consumption of fish tainted with

methylmercury, a highly toxic mercury compound – young children and unborn babies are especially at risk. This is why women are strongly cautioned to avoid consumption of many kinds of fish before, during, or right after pregnancy. Exposure to methylmercury while still young or in the womb can have an irreversible impact on a child's development, including birth defects, brain damage, reduced IQ, and difficulty with reading, writing, and learning.

The EPA estimates that **more than 300,000 babies are born every year with an increased risk of learning disability due to *in utero* exposure to methylmercury.**⁴ Cement plants are among the worst mercury polluters. The EPA's recently finalized health protections will reduce cement plants' mercury emissions by more than 90 percent – in addition to dramatic cuts in other pollutants that impact our health such as lead, acid gases, and soot. We urge you to defend these health protections from efforts by your colleagues to block them from ever taking effect. Colorado moms are counting on it.

FISH CONSUMPTION ADVISORIES

In 2009 the Colorado Department of Public Health and Environment began an on going study testing mercury, selenium, and arsenic in fish tissue samples from approximately 120 water bodies in Colorado. Of the 112 water bodies tested approximately one in five have required fish consumption advisories for mercury. Water bodies with fish advisories for pregnant women and children under 6 include Brush Hollow Reservoir, Trinidad Lake, Sanchez Reservoir, Totten Lake, Purdy Mesa Reservoir, Catamount Lake, Lake Granby(Arapahoe National Recreation Area), Carter Lake, and Horsetooth Reservoir.⁵
